## **PREFACE AND ACKNOWLEDGEMENTS**

No meaningful developmental activity can be undertaken without taking into account the characteristics of the population for whom the activity is targeted. The size of the population and its spatial distribution, growth and change over time, in addition to its socio-economic characteristics are all important in development planning.

A population census is the most important source of data on the size, composition, growth and distribution of a country's population at the national and sub-national levels. Data from the 2010 Population and Housing Census (PHC) will serve as reference for equitable distribution of national resources and government services, including the allocation of government funds among various regions, districts and other sub-national populations to education, health and other social services.

The Ghana Statistical Service (GSS) is delighted to provide data users, especially the Metropolitan, Municipal and District Assemblies, with district-level analytical reports based on the 2010 PHC data to facilitate their planning and decision-making.

The District Analytical Report for the Ahafo Ano North District is one of the 216 district census reports aimed at making data available to planners and decision makers at the district level. In addition to presenting the district profile, the report discusses the social and economic dimensions of demographic variables and their implications for policy formulation, planning and interventions. The conclusions and recommendations drawn from the district report are expected to serve as a basis for improving the quality of life of Ghanaians through evidence-based decision-making, monitoring and evaluation of developmental goals and intervention programmes.

For ease of accessibility to the census data, the district report and other census reports produced by the GSS will be disseminated widely in both print and electronic formats. The report will also be posted on the GSS website: [www.statsghana.gov.gh](http://www.statsghana.gov.gh).

The GSS wishes to express its profound gratitude to the Government of Ghana for providing the required resources for the conduct of the 2010 PHC. While appreciating the contribution of our Development Partners (DPs) towards the successful implementation of the Census, we wish to specifically acknowledge the Department for Foreign Affairs, Trade and Development (DFATD) formerly the Canadian International Development Agency (CIDA) and the Danish International Development Agency (DANIDA) for providing resources for the preparation of all the 216 district reports. Our gratitude also goes to the Metropolitan, Municipal and District Assemblies, the Ministry of Local Government, Consultant Guides, Consultant Editors, Project Steering Committee members and their respective institutions for their invaluable support during the report writing exercise. Finally, we wish to thank all the report writers, including the GSS staff who contributed to the preparation of the reports, for their dedication and diligence in ensuring the timely and successful completion of the district census reports.

**Dr. Philomena Nyarko**

# EXECUTIVE SUMMARY

## Introduction

The district census report is the first of its kind since the first post-independence census in 1960. The report provides basic information about the District. It gives a brief background of the District, describing its physical features, political and administrative structure, socio-cultural structure and economy. Using data from the 2010 Population and Housing Census (2010 PHC), the report discusses the population characteristics of the District, fertility, mortality, migration, marital status, literacy and education, economic activity status, occupation, employment; Information Communication Technology (ICT), disability, agricultural activities and housing conditions. The key findings of the analysis are as follows (references are to the relevant sections of the report):

## Population size, structure and composition

The population of Ahafo Ano North District, according to the 2010 Population and Housing Census, is 94,285 representing 2.0 percent of the region's total population of 4,780,380. Males constitute 50.9 percent and females represent 49.1 percent. About 81.0 percent of the population in the District live in rural areas. The District has a sex ratio of 103.5 and a youthful population (with 44.1% percent of the population being children less than 15 years) depicting a broad base population pyramid which tapers off with a small number of elderly persons (6.5%). The total age dependency ratio for the District is 84.2. The age dependency ratio for males is higher (86.4) than that of females (81.9).

## Fertility, mortality and migration

The Total Fertility Rate (TFR) of 3.9 for the District is higher than the Regional average of 3.3. The General Fertility Rate (GFR) for the district is 118.6 births per 1000 women aged 15-49 years. The Crude Birth Rate (CBR) is 28.0 per 1000 population while the crude death rate for the District is 5.0 per 1000. Accident/violence/homicide/suicide accounted for 11.9 percent of all deaths while other causes constitute 88.1 percent of deaths in the District. Forty-three percent of the District's population are migrants. Forty-five percent of migrants in the district were born in other localities in the Ashanti Region. For migrants born in other regions, those born in the Upper East region form the majority (17.1%).

## Household Size, composition and structure

The District has a household population of 92,924 with a total number of 20,994 households. The average household size in the District is 4.4 persons per household. Children constitute the largest proportion of the household structure (accounting for 44.5%). Spouses form 11.4 percent of the household population. Nuclear households (head, spouse(s) and children) constitute 32.0 percent of the total number of households in the District.

## Marital status

About four in ten (44.8%) of the population aged 12 years and older are married, 40.1 percent have never married while 6.1 percent are in consensual unions. Widows form 3.8 percent of the population aged 12 years and older with the divorced constituting 3.7 percent. By age 25-29 years, more than half of females (62.2%) are married compared to a little above one-third of males (38.6%). At age 65 and above, widowed females account for half of the population aged 12 years and above while widowed males account for 8.1 percent. Among the married, 42.6 percent have no education while 9.8 percent of the never-married have no education. More than

half of the married population (86.1%) are employed, 1.8 percent are unemployed and 12.1 percent are economically not active. A greater proportion of those who have never married (66.9%) are economically not active with 3.8 percent of them being unemployed.

### **Nationality**

The proportion of Ghanaians by birth in the District is 95.1 percent. Those who are Ghanaians by naturalisation constitute 0.7 percent and the non-Ghanaian population in the District is 2.1 percent.

### **Literacy and education**

Of the population 11 years and older, 71.4 percent are literate and 28.6 percent are non-literate. The proportion of literate males is higher (54.6%) than that of females (45.4%). Seven out of ten people (70.2%) indicated they could read and write both in English and in a Ghanaian language. Of the population aged 3 years and older, 24.8 percent have never attended school, 41.7 percent are currently attending school and 33.5 percent have attended school in the past.

### **Economic Activity Status**

About 72.1 percent of the population aged 15 years and older are economically active while 27.9 per cent are economically not active. Of the economically active population, 95.7 percent are employed while 4.3 percent are unemployed. For those who are economically not active, a larger percentage are students (54.3%) with 24.2 percent performing household duties and another 5.2 percent being disabled or too sick to work. Seven out of ten unemployed persons are seeking work for the first time.

### **Occupation**

Of the employed population, 69.2 percent are engaged as skilled agricultural, forestry and fishery workers, 11.7 percent in service and sales work, 6.8 percent in craft and related trade, and 0.9 percent engaged as managers, professionals, and technicians.

### **Employment status and sector**

Of the population 15 years and older, 65.2 percent are self-employed without employees, 12.7 percent are contributing family workers, 3.8 percent are casual workers and 0.7 percent are domestic employees (house helps). Overall, men constitute the highest proportion in each employment category except the contributing family workers and apprentices. The private informal sector is the largest employer in the District, employing 92.2 percent of the population followed by the public sector with 5.4 percent.

### **Information Communication Technology**

About thirty-three percent of the population 12 years and older have mobile phones. Men who own mobile phones constitute 38.3 percent as compared to 27.8 percent of females. A little over one percent of the population 12 years and older use internet facilities in the District. Only 554 households representing 2.6 percent of the total households in the District have desktop/laptop computers.

### **Disability**

About 2.4 percent of the District's total population have one form of disability or the other. The proportion of the female population with disability is slightly higher (2.4%) than males (2.3%) with disability. The types of disability in the District include sight, hearing, speech, physical, intellect, and emotion. Persons with sight disability are the highest (45.4%) group of

disabled persons in the district followed by physical disability (26.4%). About 3.3 percent of the urban population are with disability. Of all the persons with disability, 43.6 percent have never attended school.

### **Agriculture**

About 74.0 percent of households in the District are engaged in agriculture. In the rural localities, eight out of ten households (84.0%) are agricultural households while in the urban localities, 40.9 percent of households are into agriculture. Most households in the District (98.3%) are involved in crop farming. Poultry (chicken) is the dominant animals reared in the District.

### **Housing**

The total housing stock for Ahafo Ano North District is 14,819 representing 2.6 percent of the total number of houses in the Ashanti Region. The average number of persons per house is 6.3.

#### ***Type of dwelling, tenancy arrangement and ownership of dwelling units***

Almost half (49.2%) of all dwelling units in the District are compound houses; 32.0 percent are separate houses and 7.4 percent are semi-detached houses. More than half (55.1%) of the dwelling units in the District are owned by members of the household; 21.8 percent are owned by other private individuals; 13.2 percent are owned by a relative who is not a member of the household and 2.0 percent are owned by the public/government. Less than one percent (0.9%) of the dwelling units is owned through mortgage schemes.

#### ***Material for construction of outer wall, floor and roof***

The main construction material for outer walls of dwelling units in the District is mud/mud bricks or earth accounting for 62.9 percent of all dwelling units with cement/concrete constituting 30.9 percent of outer walls of dwelling units in the District. Cement (68.6%) and mud/earth (29.3%) are the two main materials used in the construction of floors of dwelling units in the District. Metal sheets are the main roofing material (92.8 %) for dwelling units in the District.

#### ***Room occupancy***

One room occupancy constitutes the highest percentage (56.2%) of sleeping rooms occupied by households in housing units in the District. About 5.3 percent of households with 10 or more members occupy single rooms.

#### ***Utilities and household facilities***

The three main sources of lighting in dwelling units in the District are flashlight/torch (49.0%), electricity (36.2%) and kerosene lamp (13.1%). The main source of fuel for cooking for most households in the District is wood (71.4%). The proportion of rural households (84.8%) using wood as the main source of cooking fuel is higher than that of urban households (25.0%). The four main sources of water in the District are borehole, river stream, public tap and pipe borne water. About 43.2 of households use boreholes as their main source of water for drinking.

The most common type of toilet facility used in the District is public toilet (WC, KVIP, Pit, Pan) which is used by 49.4 percent of households in the District, followed by pit latrine (35.7%). About 4.0 percent of the population in the District have no toilet facility. A little over a third of households (36.0%) in the District share separate bathrooms with other households in the same house while 25.5 percent own bathrooms for their exclusive use.

### ***Waste disposal***

The most widely used method of solid waste disposal in the District is public dump (in the open space) which is used by 66.9 percent of all households. One in ten households (12.3%) dump their solid waste indiscriminately. House to house waste collection is used by 3.4 percent of households. For liquid waste disposal, throwing onto the compound (49.2%) and throwing onto the street (33.5%) are the two most common methods used by households in the District.

# CHAPTER ONE

## INTRODUCTION

### 1.1 Background

Ahafo Ano North was created by an Act of Parliament in 1988 by a Legislative Instrument (LI 1402) and is located in north western part of Ashanti Region.

The district is located between latitude  $6^{\circ} 47'N$  and  $7^{\circ} 02'N$  and longitude  $2^{\circ} 26'W$  and  $2^{\circ} 04'W$  with a total landmass of  $593.7km^2$ . The district capital is Tapa and distance from the district to Kumasi is 70km. The notable towns in the district are Manfo, Akwasiase, Mabang, Anyinasuso, Asuhyiae and Betiako.

The district shares boundaries with five districts, Tano North and South to the north, to the south by Atwima Mponua, and to the west by Asutifi South, and on the east by Ahafo Ano South District as depicted in figure 1.1.

### 1.2 Physical Features

The district is located on the forest dissected plateau with Pre-Cambrian rocks of Birimean formation underlie this physiographic district. The land rises from about 700 feet in the western part to about 900 feet above sea level. The topography is very undulating subjecting it to erosion and therefore lowering the productivity of the land.

The area is characterized by gentle rolling landscape with many rivers such as Tano River with many tributaries such as Kwasu, Anyinasu and Abu that exhibit a dendritic pattern of drainage. Tano and its tributaries converge at Asuhyiae which when developed could serve as tourist attraction.

Most of the streams in the district dry-up during the dry season making them impossible to be used for irrigation.

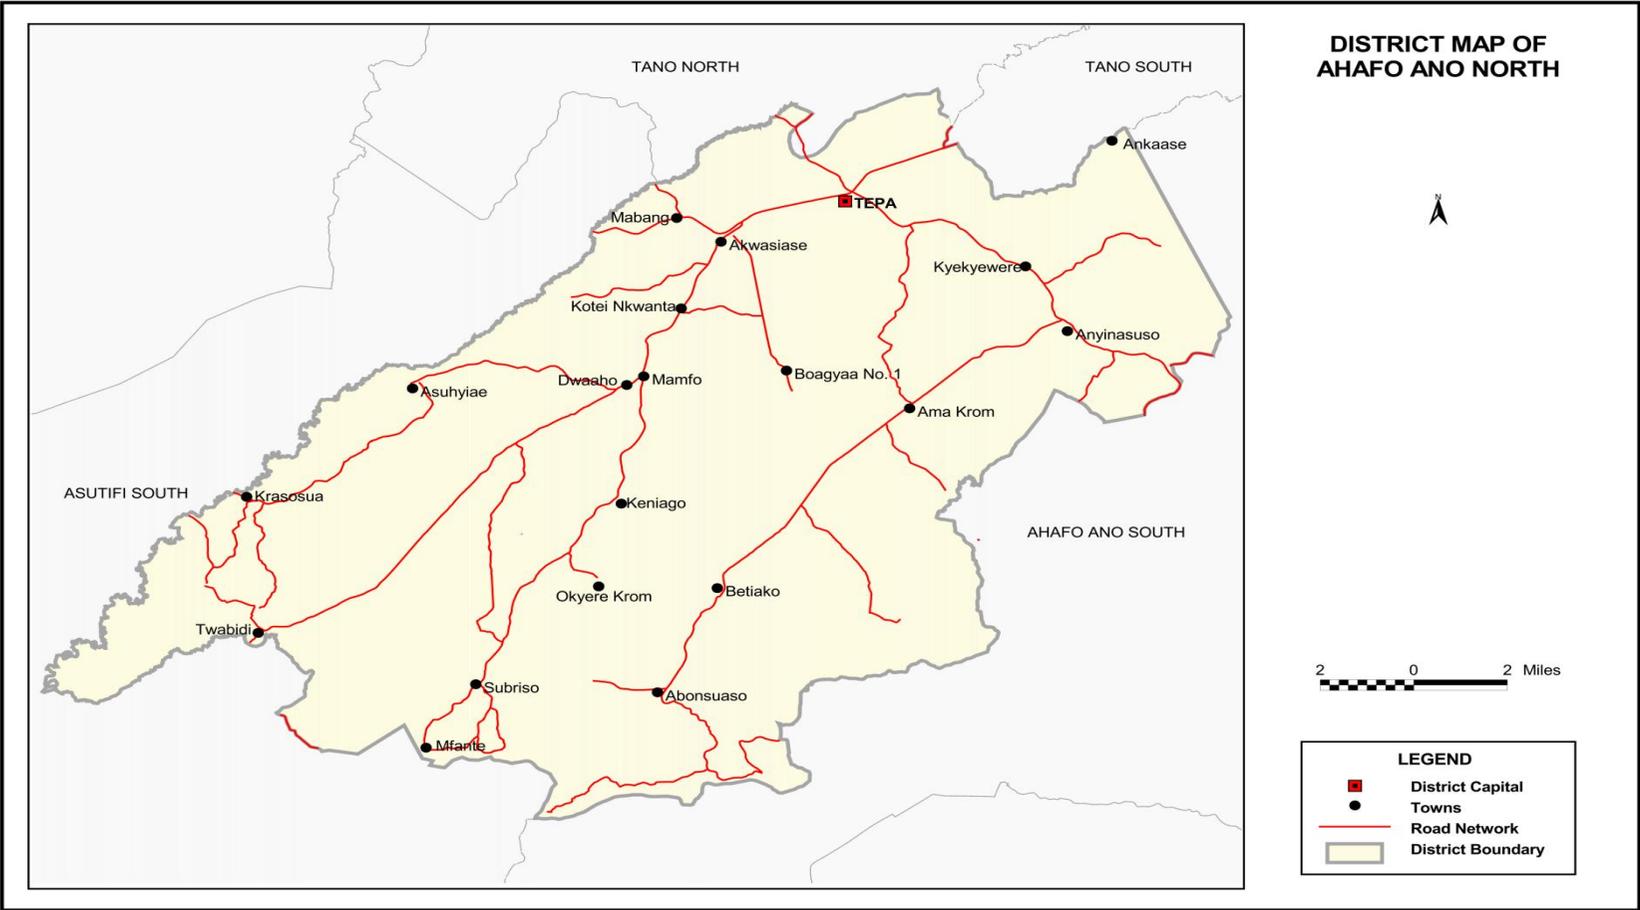

#### 1.2.1 Vegetation and climatic conditions

The district lies within the wet semi equatorial zone marked by double maxima rainfall in June and October with a mean annual rainfall of 1750mm. Temperatures are fairly high with a range between  $26^{\circ}C$  in August and  $30^{\circ}C$  in March which favours the cultivation of cocoa and many food crops.

The vegetation of the area is mostly moist deciduous forest type, which does not differ much from the rainforest. Most of the trees shed their leaves during the dry season but not at the same time. Some economic trees found in the area are the sapele, odum, wawa and mahogany.

The district has two major forest reserves namely Disire Forest Reserve at the southern part of the district and the Tinte Beposo Forest Reserve located at the north-eastern part of the district. The farmlands and forest reserves are stocked with valuable timber like wawa, odum, sapele and mahogany. There are other forestry products like cane, fauna and trees of high medicinal value as seen in the Tinte Beposo West Extension Forest reserve and the Disire forest reserve. These resources offer opportunity not only for lumbering but also for the establishment of wood based industries like saw mills, cane weaving and others.

Figure 1.1: Ahafo Ano North district map

Source: Ghana Statistical Service

### **1.2.2 Geology and Minerals**

The District is endowed with many natural resources, including the Birimian rock formation which is the most important geological formation in the country as it is the mineral bearing rock. A number of areas are reported to have deposits of minerals. These reported mineral deposits include gold at around Subriso and clay deposits at Mabang.

There is a total of 520km road network in the District out of which 35km length is first class. The rest 485km are feeder roads most of which become unmotorable during the rainy season, thus hampering movement of people and goods.

### **1.3 Political Administration**

The Ahafo Ano North District is made up of thirty nine (39) electoral areas with one constituency and 39 unit committees. The district has been divided into 7 sub-structures made up of six Area Councils and one Town Council, namely; Anyinasuso, Subriso, Biakoye, Kwasi Abu, Abu-Bone, Suponso and Tapa Town Council. All the councils are not fully functional due to financial and human resource constraints.

### **1.4 Social and Cultural Structure**

The 2010 Population and Housing Census put the population of the district at 94,285 and giving rise to a population density of 158. This is made up of 47,956 males (50.9%) and 46,329 females (49.1%) which indicates high sex ratio of 103.5. Between 2000 and 2010, the population of the district increased from 71,952 to 94,285, representing 2.96 percent annual growth rate.

The 2010 PHC figure depicts that more than two thirds of the population (68.6%) are Christians (Catholic, Protestant, Pentecostal/Charismatic and other Christians) followed by Islam (22.3%).

There is only one hospital in the district with five health centres evenly spread across the district. Tapa District Hospital provides the highest health services in the district and serves as a referral centre for the district. It provides a variety of health services and attracts people from adjoining districts. There are also about 32 out-reach posts. Currently, the district has only one medical doctor at the district hospital, five medical assistants and 19 midwives manning the health facilities in the district.

The district has 68 primary schools and kindergartens, 48 JHS and two Senior High schools with one Midwifery and Health Assistant Training School. A total of 23,036 pupils are in school at various educational levels in the district as stated in GES 2012 annual report.

More than half of the communities have been provided with either hand dug wells with pumps or boreholes and the Tapa, Akwasiase and Mabang supplied with pipe borne water. Forteen communities have been provided with mechanised bore holes with solar pumps. (2010 PHC)

Akwasiase Festival is celebrated in all the traditional areas to display the rich culture to the outside world, make family gatherings and plan development projects for the area. Yam Festival is celebrated by the people of Tapa Traditional Area. The Chief uses the occasion to outline development projects being carried out in the area to the people and to solicit for their support and assistance either in cash or in kind. Appeal for funds is also made and the proceeds are used for on-going projects.

## **1.5 Economy**

The main occupation of the people in the Ahafo Ano North District is farming. Agriculture alone employs nearly 70% of the total labour force, both direct and indirect. The next sector is commerce, which also employs 13% and industry, mainly small scale, 4%. Many traders from these areas converge at Tewa weekly market to sell their goods due to its geographical position and in turn buy local staples like plantain, cassava, maize, vegetables in large quantities. The traditional crops grown in the district are, cocoa, plantain, maize, cocoyam, cassava, rice, oil palm, citrus and vegetables. Some farmers are engaged in the cultivation of non-traditional crops such as, black pepper and sweet berry. Poultry and livestock raised include, sheep, goats, cattle, grass cutter, snails etc. Fish farming is also practised on a smaller scale at various places in the district. The District has low industrial base. The few industries in the district are agro-based related industries such as gari production and palm oil extraction, wood - based industries for timber processing and metal based industries, for example blacksmithing.

There is a considerable increase in the number of financial services in the district within the last few years. Banking and non-banking financial institutions have opened branches in the district mobilizing resources to support the small and medium enterprises in the district.

Ghana Commercial Bank, SG-SSB Bank and other rural banks notably Tepaman, Derma Area and Ahafo Ano Premier Rural banks are well established with enviable records as far as quality banking and client confidence is concerned. There are other non-bank financial institutions such as Lord Winners, Money Link and SMMET Credit Union in the district. These financial institutions provide credit facilities to their customers especially those in the informal sector.

The District has undulating landscape with few high grounds between Dwaaho and Manfo. This area has beautiful scenery and currently serves as an ideal praying ground for religious groups. Similarly, River Tano and its tributaries converging at Asuhyiae have attractive scenery thus making it a high tourist potential.

Currently the district can boast of telephone services from Vodafone, MTN, Tigo, Airtel and Glo service providers. Postal services are available in only Tewa, the district capital where there is modern post office building facility attached with internet service.

## **1.6 Census Methodology, Concepts and Definitions**

### **1.6.1 Introduction**

Ghana Statistical Service (GSS) was guided by the principle of international comparability and the need to obtain accurate information in the 2010 Population and Housing Census (2010 PHC). The Census was, therefore, conducted using all the essential features of a modern census as contained in the United Nations Principles and Recommendations for countries taking part in the 2010 Round of Population and Housing Censuses.

Experience from previous post independence censuses of Ghana (1960, 1970, 1984 and 2000) was taken into consideration in developing the methodologies for conducting the 2010 PHC. The primary objective of the 2010 PHC was to provide information on the number, distribution and social, economic and demographic characteristics of the population of Ghana necessary to facilitate the socio-economic development of the country.

## **1.6.2 Pre-enumeration activities**

### **Development of census project document and work plans**

A large scale statistical operation, such as the 2010 Population and Housing Census required meticulous planning for its successful implementation. A working group of the Ghana Statistical Service prepared the census project document with the assistance of two consultants. The document contains the rationale and objectives of the census, census organisation, a work plan as well as a budget. The project document was launched in November 2008 as part of the Ghana Statistics Development Plan (GSDP) and reviewed in November 2009.

### **Census secretariat and committees**

A well-structured management and supervisory framework that outlines the responsibilities of the various stakeholders is essential for the effective implementation of a population and housing census. To implement the 2010 PHC, a National Census Secretariat was set up in January 2008 and comprised professional and technical staff of GSS as well as staff of other Ministries, Departments and Agencies (MDAs) seconded to GSS. The Census Secretariat was primarily responsible for the day-to-day planning and implementation of the census activities. The Secretariat had seven units, namely; census administration, cartography, recruitment and training, publicity and education, field operations and logistics management, data processing, and data analysis and dissemination.

The Census Secretariat was initially headed by an acting Census Coordinator engaged by the United Nations Population Fund (UNFPA) in 2008 to support GSS in the planning of the Census. In 2009, the Census Secretariat was re-organised with the Government Statistician as the National Chief Census Officer and overall Coordinator, assisted by a Census Management Team and a Census Coordinating Team. The Census Management Team had oversight responsibility for the implementation of the Census. It also had the responsibility of taking critical decisions on the census in consultation with other national committees. The Census Coordinating Team, on the other hand, was responsible for the day-to-day implementation of the Census programme.

A number of census committees were also set up at both national and sub-national levels to provide guidance and assistance with respect to resource mobilization and technical advice. At the national level, the committees were the National Census Steering Committee (NCSC), the National Census Technical Advisory Committee (NCTAC) and the National Census Publicity and Education Committee (NCPEC). At the regional and district levels, the committees were the Regional Census Implementation Committee and the District Census Implementation Committee, respectively.

The Regional and District Census Implementation Committees were inter-sectoral in their composition. Members of the Committees were mainly from decentralized departments with the Regional and District Coordinating Directors chairing the Regional Census Implementation Committee and District Census Implementation Committee, respectively. The Committees contributed to the planning of district, community and locality level activities in areas of publicity and field operations. They supported the Regional and District Census Officers in the recruitment and training of field personnel (enumerators and supervisors), as well as mobilizing logistical support for the census.

## **Selection of Census topics**

The topics selected for the 2010 Population and Housing Census were based on recommendations contained in the UN Principles and Recommendations for 2010 Round of Population and Housing Censuses and the African Addendum to that document as well as the needs of data users. All the core topics recommended at the global level, i.e., geographical and internal migration characteristics, international migration, household characteristics, demographic and social characteristics such as age, date of birth, sex, and marital status, fertility and mortality, educational and economic characteristics, issues relating to disability and housing conditions and amenities were included in the census.

Some topics that were not considered core by the UN recommendations but which were found to be of great interest and importance to Ghana and were, therefore, included in the 2010 PHC are religion, ethnicity, employment sector and place of work, agricultural activity, as well as housing topics, such as, type of dwelling, materials for outer wall, floor and roof, tenure/holding arrangement, number of sleeping rooms, cooking fuel, cooking space and Information Communication Technology (ICT).

## **Census mapping**

A timely and well implemented census mapping is pivotal to the success of any population and housing census. Mapping delineates the country into enumeration areas to facilitate smooth enumeration of the population. The updating of the 2000 Census Enumeration Area (EA) maps started in the last quarter of 2007 with the acquisition of topographic sheets of all indices from the Survey and Mapping Division of the Lands Commission. In addition, digital sheets were also procured for the Geographical Information System Unit.

The Cartography Unit of the Census Secretariat collaborated with the Survey and Mapping Division of the Lands Commission and the Centre for Remote Sensing and Geographic Information Services (CERSGIS) of the Department of Geography and Resource Development, University of Ghana, to determine the viability of migrating from analogue to digital mapping for the 2010 PHC, as recommended in the 2000 PHC Administrative Report. Field cartographic work started in March 2008 and was completed in February 2010.

## **Development of questionnaire and manuals**

For effective data collection, there is the need to design appropriate documents to solicit the required information from respondents. GSS consulted widely with main data users in the process of the questionnaire development. Data users including MDAs, research institutions, civil society organisations and development partners were given the opportunity to indicate the type of questions they wanted to be included in the census questionnaire.

Documents developed for the census included the questionnaire and manuals, and field operation documents. The field operation documents included Enumerator's Visitation Record Book, Supervisor's Record Book, and other operational control forms. These record books served as operational and quality control tools to assist enumerators and supervisors to control and monitor their field duties respectively.

## **Pre-tests and trial census**

It is internationally recognized that an essential element in census planning is the pre-testing of the questionnaire and related instructions. The objective of the pre-test is to test the

questionnaire, the definition of its concepts and the instructions for filling out the questionnaire.

The census questionnaire was pre-tested twice in the course of its development. The first pre-test was carried out in March 2009 to find out the suitability of the questions and the instructions provided. It also tested the adequacy and completeness of the responses and how respondents understood the questions. The second pre-test was done in 10 selected enumeration areas in August, 2009. The objective of the second pre-test was to examine the sequence of the questions, test the new questions, such as, date of birth and migration, and assess how the introduction of 'date of birth' could help to reduce 'age heaping'. With regard to questions on fertility, the pre-tests sought to find out the difference, if any, between proxy responses and responses by the respondents themselves. Both pre-tests were carried in the Greater Accra Region. Experience from the pre-tests was used to improve the final census questionnaire.

A trial census which is a dress rehearsal of all the activities and procedures that are planned for the main census was carried out in October/November 2009. These included recruitment and training, distribution of census materials, administration of the questionnaire and other census forms, enumeration of the various categories of the population (household, institutional and floating population), and data processing. The trial census was held in six selected districts across the country namely; Saboba (Northern Region), Chereponi (Northern Region), Sene (Brong Ahafo Region), Bia (Western Region), Awutu Senya (Central Region), and Osu Klottey Sub-Metro (Greater Accra Region). A number of factors were considered in selecting the trial census districts. These included: administrative boundary issues, ecological zone, and accessibility, enumeration of floating population/outdoor-sleepers, fast growing areas, institutional population, and enumeration areas with scattered settlements.

The trial census provided GSS with an opportunity to assess its plans and procedures as well as the state of preparedness for the conduct of the 2010 PHC. The common errors found during editing of the completed questionnaires resulted in modifications to the census questionnaire, enumerator manuals and other documents. The results of the trial census assisted GSS to arrive at technically sound decisions on the ideal number of persons per questionnaire, number of persons in the household roster, migration questions, placement of the mortality question, serial numbering of houses/housing structures and method of collection of information on community facilities. Lessons learnt from the trial census also guided the planning of the recruitment process, the procedures for training of census field staff and the publicity and education interventions.

### **1.6.3 Census Enumeration**

#### **Method of enumeration and field work**

All post-independence censuses (1960, 1970, 1984, and 2000) conducted in Ghana used the de facto method of enumeration where people are enumerated at where they were on census night and not where they usually reside. The same method was adopted for the 2010 PHC. The de facto count is preferred because it provides a simple and straight forward way of counting the population since it is based on a physical fact of presence and can hardly be misinterpreted. It is thought that the method also minimizes the risks of under-enumeration and over enumeration. The canvasser method, which involves trained field personnel visiting houses and households identified in their respective enumeration areas, was adopted for the 2010 PHC.

The main census enumeration involved the canvassing of all categories of the population by trained enumerators, using questionnaires prepared and tested during the pre-enumeration phase. Specific arrangements were made for the coverage of special population groups, such as the homeless and the floating population. The fieldwork began on 21st September 2010 with the identification of EA boundaries, listing of structures, enumeration of institutional population and floating population.

The week preceding the Census Night was used by field personnel to list houses and other structures in their enumeration areas. Enumerators were also mobilized to enumerate residents/inmates of institutions, such as, schools and prisons. They returned to the institutions during the enumeration period to reconcile the information they obtained from individuals and also to cross out names of those who were absent from the institutions on Census Night. Out-door sleepers (floating population) were also enumerated on the Census Night.

Enumeration of the household population started on Monday, 27<sup>th</sup> September, 2010. Enumerators visited houses, compounds and structures in their enumeration areas and started enumerating all households including visitors who spent the Census Night in the households. Enumeration was carried out in the order in which houses/structures were listed and where the members of the household were absent, the enumerator left a call-back-card indicating when he/she would come back to enumerate the household. The enumeration process took off smoothly with enumerators poised on completing their assignments on schedule since many of them were teachers and had to return to school. However, many enumerators ran short of questionnaires after a few days' work.

Enumeration resumed in all districts when the questionnaire shortage was resolved and by 17<sup>th</sup> October, 2010, enumeration was completed in most districts. Enumerators who had finished their work were mobilized to assist in the enumeration of localities that were yet to be enumerated in some regional capitals and other fast growing areas. Flooded areas and other inaccessible localities were also enumerated after the end of the official enumeration period. Because some enumeration areas in fast growing cities and towns, such as, Accra Metropolitan Area, Kumasi, Ksoa and Techiman were not properly demarcated and some were characterized by large EAs, some enumerators were unable to complete their assigned tasks within the stipulated time.

#### **1.6.4 Post Enumeration Survey**

In line with United Nations recommendations, GSS conducted a Post Enumeration Survey (PES) in April, 2011 to check content and coverage error. The PES was also to serve as an important tool in providing feedback regarding operational matters such as concepts and procedures in order to help improve future census operations. The PES field work was carried out for 21 days in April 2011 and was closely monitored and supervised to ensure quality output. The main findings of the PES were that:

- 97.0 percent of all household residents who were in the country on Census Night (26<sup>th</sup> September, 2010) were enumerated.
- 1.3 percent of the population was erroneously included in the census.
- Regional differentials are observed. Upper East region recorded the highest coverage rate of 98.2 percent while the Volta region had the lowest coverage rate of 95.7 percent.

- Males (3.3%) were more likely than females (2.8%) to be omitted in the census. The coverage rate for males was 96.7 percent and the coverage rate for females was 97.2 percent. Also, the coverage rates (94.1%) for those within the 20-29 and 30-39 age groups are relatively lower compared to the coverage rates of the other age groups.
- There was a high rate of agreement between the 2010 PHC data and the PES data for sex (98.8%), marital status (94.6%), relationship to head of household (90.5%) and age (83.0%).

### **1.6.5 Release and dissemination of results**

The provisional results of the census were released in February 2011 and the final results in May 2012. A National Analytical report, six thematic reports, a Census Atlas, 10 Regional Reports and a report on Demographic, Social, Economic and Housing were prepared and disseminated in 2013.

### **1.6.6 Concepts and definitions**

#### **Introduction**

The 2010 Population and Housing Census of Ghana followed the essential concepts and definitions of a modern Population and Housing Census as recommended by the United Nations (UN). It is important that the concepts, definitions and recommendations are adhered to since they form the basis upon which Ghana could compare her data with that of other countries.

The concepts and definitions in this report cover all sections of the 2010 Population and Housing Census questionnaires (PHC1A and PHC1B). The sections were: geographical location of the population, Household and Non-household population, Literacy and Education, Emigration, Demographic and Economic Characteristics, Disability, Information and Communication Technology (ICT), Fertility, Mortality, Agricultural Activity and Housing Conditions.

The concepts and definitions are provided to facilitate understanding and use of the data presented in this report. Users are therefore advised to use the results of the census within the context of these concepts and definitions.

#### **Region**

There were ten (10) administrative regions in Ghana during the 2010 Population and Housing Census as they were in 1984 and 2000.

#### **District**

In 1988, Ghana changed from the local authority system of administration to the district assembly system. In that year, the then existing 140 local authorities were demarcated into 110 districts. In 2004, 28 new districts were created; this increased the number of districts in the country to 138. In 2008, 32 additional districts were created bringing the total number of districts to 170. The 2010 Population and Housing Census was conducted in these 170 administrative districts (these are made-up of 164 districts/municipals and 6 metropolitan areas). In 2012, 46 new districts were created to bring the total number of districts to 216. There was urgent need for data for the 46 newly created districts for planning and decision-making. To meet this demand, the 2010 Census data was re-programmed into 216 districts

after carrying out additional fieldwork and consultations with stakeholders in the districts affected by the creation of the new districts.

### **Locality**

A locality was defined as a distinct population cluster (also designated as inhabited place, populated centre, settlement) which has a NAME or LOCALLY RECOGNISED STATUS. It included fishing hamlets, mining camps, ranches, farms, market towns, villages, towns, cities and many other types of population clusters, which meet the above criteria. There were two main types of localities, rural and urban. As in previous censuses, the classification of localities into 'urban' and 'rural' was based on population size. Localities with 5,000 or more persons were classified as urban while localities with less than 5,000 persons were classified as rural.

### **Population**

The 2010 Census was a "de facto" count and each person present in Ghana, irrespective of nationality, was enumerated at the place where he/she spent the midnight of 26th September 2010.

### **Household**

A household was defined as a person or a group of persons, who lived together in the same house or compound and shared the same house-keeping arrangements. In general, a household consisted of a man, his wife, children and some other relatives or a house help who may be living with them. However, it is important to remember that members of a household are not necessarily related (by blood or marriage) because non-relatives (e.g. house helps) may form part of a household.

### **Head of Household**

The household head was defined as a male or female member of the household recognised as such by the other household members. The head of household is generally the person who has economic and social responsibility for the household. All relationships are defined with reference to the head.

### **Household and Non-household population**

Household population comprised of all persons who spent the census night in a household setting. All persons who did not spend the census night in a household setting (except otherwise stated) were classified as non-household population. Persons who spent census night in any of the under listed institutions and locations were classified as non-household population:

- (a) Educational institutions
- (b) Children's and old people's homes
- (c) Hospitals and healing centres
- (d) Hotels
- (e) Prisons
- (f) Service barracks

(g) Soldiers on field exercise

(h) Floating population: The following are examples of persons in this category:

- i. All persons who slept in lorry parks, markets, in front of stores and offices, public bathrooms, petrol filling stations, railway stations, verandas, pavements, and all such places which are not houses or compounds.
- ii. Hunting and fishing camps.
- iii. Beggars and vagrants (mentally sick or otherwise).

### **Age**

The age of every person was recorded in completed years disregarding fractions of days and months. For those persons who did not know their birthdays, the enumerator estimated their ages using a list of district, regional and national historical events.

### **Nationality**

Nationality is defined as the country to which a person belongs. A distinction is made between Ghanaians and other nationals. Ghanaian nationals are grouped into Ghanaian by birth, Ghanaian with dual nationality and Ghanaian by naturalization. Other nationals are grouped into ECOWAS nationals, Africans other than ECOWAS nationals, and non-Africans.

### **Ethnicity**

Ethnicity refers to the ethnic group that a person belonged to. This information is collected only from Ghanaians by birth and Ghanaians with dual nationality. The classification of ethnic groups in Ghana is that officially provided by the Bureau of Ghana Languages and which has been in use since the 1960 census.

### **Birthplace**

The birthplace of a person refers to the locality of usual residence of the mother at the time of birth. If after delivery a mother stayed outside her locality of usual residence for six months or more or had the intention of staying in the new place for six or more months, then the actual town/village of physical birth becomes the birthplace of the child.

### **Duration of Residence**

Duration of residence refers to the number of years a person has lived in a particular place. This question is only asked of persons not born in the place where enumeration took place. Breaks in duration of residence lasting less than 12 months are disregarded. The duration of residence of persons who made multiple movements of one (1) year or more is assumed to be the number of years lived in the locality (town or village) since the last movement.

### **Religion**

Religion refers to the individual's religious affiliation as reported by the respondent, irrespective of the religion of the household head or the head's spouse or the name of the person. No attempt was made to find out if respondents actually practiced the faith they professed.

## **Marital status**

Marital status refers to the respondent's marital status as at Census Night. The question on marital status was asked only of persons 12 years and older. The selection of the age limit of 12 years was based on the average age at menarche and also on the practice in some parts of the country where girls as young as 12 years old could be given in marriage.

## **Literacy**

The question on literacy referred to the respondent's ability to read and write in any language. A person was considered literate if he/she could read and write a simple statement with understanding. The question on literacy was asked only of persons 11 years and older.

## **Education**

### ***School Attendance***

Data was collected on school attendance for all persons three (3) years and older. School attendance refers to whether a person has ever attended, was currently attending or has never attended school. In the census, school meant an educational institution where a person received at least four hours of formal education.

Although the lower age limit of formal education is six years for primary one, eligibility for the school attendance question was lowered to three years because pre-school education has become an important phenomenon in the country.

### ***Level of Education***

Level of education refers to the highest level of formal school that a person ever attended or was attending. This information was obtained for persons 3 years and older.

## **Activity Status**

Activity status refers to economic or non-economic activity of respondents during the 7 days preceding census night. Information on type of activity was collected on persons 5 years and older. A person was regarded as economically active if he/she:

- a. Worked for pay or profit or family gain for at least 1 hour within the 7 days preceding Census Night. This included persons who were in paid employment or self-employment or contributing family workers.
- b. Did not work, but had jobs to return to.
- c. Were unemployed.

The economically not active were persons who did not work and were not seeking for work. They were classified by reasons for not being economically active. Economically not active persons included homemakers, students, retired persons, the disabled and persons who were unable to work due to their age or ill-health.

## **Occupation**

This referred to the type of work the person was engaged in at the establishment where he/she worked. This was asked only of persons 5 years and older who worked 7 days before the census night, and those who did not work but had a job to return to as well as those unemployed who had worked before. All persons who worked during the 7 days before the

census night were classified by the kind of work they were engaged in. The emphasis was on the work the person did during the reference period and not what he/she was trained to do. For those who did not work but had a job to return to, their occupation was the job they would go back to after the period of absence. Also, for persons who had worked before and were seeking for work and available for work, their occupation was on the last work they did before becoming unemployed. If a person was engaged in more than one occupation, only the main one was considered.

### **Industry**

Industry referred to the type of product produced or service rendered at the respondent's work place. Information was collected only on the main product produced or service rendered in the establishment during the reference period.

### **Employment Status**

Employment status refers to the status of a person in the establishment where he/she currently works or previously worked. Eight employment status categories were provided: employee, self-employed without employees, self-employed with employees, casual worker, contributing family worker, apprentice, domestic employee (house help). Persons who could not be classified under any of the above categories were classified as "other".

### **Employment Sector**

This refers to the sector in which a person worked. The employment sectors covered in the census were public, private formal, private informal, semi-public/parastatal, NGOs and international organizations.

### **Disability**

Persons with disability were defined as those who were unable to or were restricted in the performance of specific tasks/activities due to loss of function of some part of the body as a result of impairment or malformation. Information was collected on persons with visual/sight impairment, hearing impairment, mental retardation, emotional or behavioural disorders and other physical challenges.

### **Information Communication Technology (ICT)**

ICT questions were asked for both individuals and households. Persons having mobile phones refer to respondents 12 years and older who owned mobile phones (irrespective of the number of mobile phones owned by each person). Persons using internet facility refers to those who had access to internet facility at home, internet cafe, on mobile phone or other mobile device. Internet access is assumed to be not only via computer, but also by mobile phones, PDA, game machine and digital television.

Households having Personal Computers/Laptops refer to households who own desktops/laptop computers. The fixed telephone line refers to a telephone line connecting a customer's terminal equipment (e.g. telephone set, facsimile machine) to the public switch telephone network.

### **Fertility**

Two types of fertility data were collected: lifetime fertility and current fertility. Lifetime fertility refers to the total number of live births that females 12 years and older had ever had

during their life time. Current fertility refers to the number of live births that females 12-54 years old had in the 12 months preceding the Census Night.

### **Mortality**

Mortality refers to all deaths that occurred in the household during the 12 months preceding the Census Night. The report presents information on deaths due to accidents, violence, homicide and suicide. In addition, data were collected on pregnancy-related deaths of females 12-54 years.

### **Agriculture**

The census sought information on household members who are engaged in agricultural activities, including the cultivation of crops or tree planting, rearing of livestock or breeding of fish for sale or family consumption. Information was also collected on their farms, types of crops and number and type of livestock.

### **Housing Conditions and Facilities**

The UN recommended definition of a house as “a structurally separate and independent place of abode such that a person or group of persons can isolate themselves from the hazards of climate such as storms and the sun” was adopted. The definition, therefore, covered any type of shelter used as living quarters, such as separate houses, semi-detached houses, flats/apartments, compound houses, huts, tents, kiosks and containers.

Living quarters or dwelling units refer to a specific area or space occupied by a particular household and therefore need not necessarily be the same as the house of which the dwelling unit may be a part.

Information collected on housing conditions included the type of dwelling unit, main construction materials for walls, floor and roof, holding/tenure arrangement, ownership type, type of lighting, source of water supply and toilet facilities. Data was also collected on method of disposal of solid and liquid waste.

## **1.7 Organization of the Report**

The report consists of nine chapters. Chapter one provides basic information about the district. It gives a brief background of the district, describing its physical features, political and administrative structure, social and cultural structure, economy and the methodology and concepts used in the report. Chapter two discusses the population size, composition and age structure. It further discusses the migratory pattern in the district as well as fertility and mortality.

In chapter three, the focus is on household size, composition and headship as well as the marital characteristics and nationality of the inhabitants of the district. The chapter also discusses the religious affiliations and the educational statuses of the members of the district. Chapter four focuses on economic characteristics such as economic activity status, occupation, industries and the employment status and sectors that the people are employed.

Information Communication Technology (ICT) is discussed in chapter five. It analyses mobile phone ownership, internet use and ownership of desktop/laptop computers while chapter six is devoted to Persons living with disabilities (PWDs) and their socio-demographic characteristics. Chapter seven concentrates on the agricultural activities of the households, describing the types of farming activities, livestock rearing and numbers of livestock reared.

In chapter eight, housing conditions such as housing stock, type of dwelling and construction materials, room occupancy, holding and tenancy, lighting and cooking facilities, bathing and toilet facilities, waste disposal and source of water for drinking or for other domestic use in the district are discussed and analyzed in detail. The final chapter, Chapter nine presents the summary of findings and conclusions. It also discusses the policy implications of the findings for the district.

## **CHAPTER TWO**

### **DEMOGRAPHIC CHARACTERISTICS**

#### **2.1 Introduction**

Demographic characteristics involve population size, distribution and age-sex composition. The changes in a country's population are mostly influenced by fertility, mortality and migration levels. The need for demographic characteristics of a population is to help plan for the welfare of the people and to provide data for others interested in further research. This chapter discusses the size and distribution of the population within the district. It will also describe the age-sex structure of people in the district. Migration, fertility and mortality, which are population dynamics, will be discussed.

#### **2.2 Population Size and Distribution**

The 2010 Population and housing census puts the district population at 94,285, comprising 47,956 males (50.9%) and 46,329 females (49.1%). The District's population of 94,285 represents 2.0 percent of the region's population. Table 2.1 presents the population size, distribution and type of locality in the district. The table again shows that more than one third (41.1%) of the population are children less than 15 years, as compared to the aged (65+) constituting only 4.6 percent.

Again the data indicates that the district has high sex ratio of 103.5, which means for every 103 males there are 100 females which deviates significantly from the national and regional averages of (95.2) and (94.0) respectively . Thus the district reported more males than females across almost all the age groups with the exception of few age groups 20-24, 25-29, 50-54, 80-84, 90-94 and 95-99. The high sex ratio in the district may be attributed to influx of mining workers in the district due to the district's proximity to Newmont Ghana concession at Kenyasi. The district is predominantly rural as 81.2 percent of the population live in rural areas with just about 19.0 percent residing in urban areas.

**Table 2.1: Population by age, sex and type of locality**

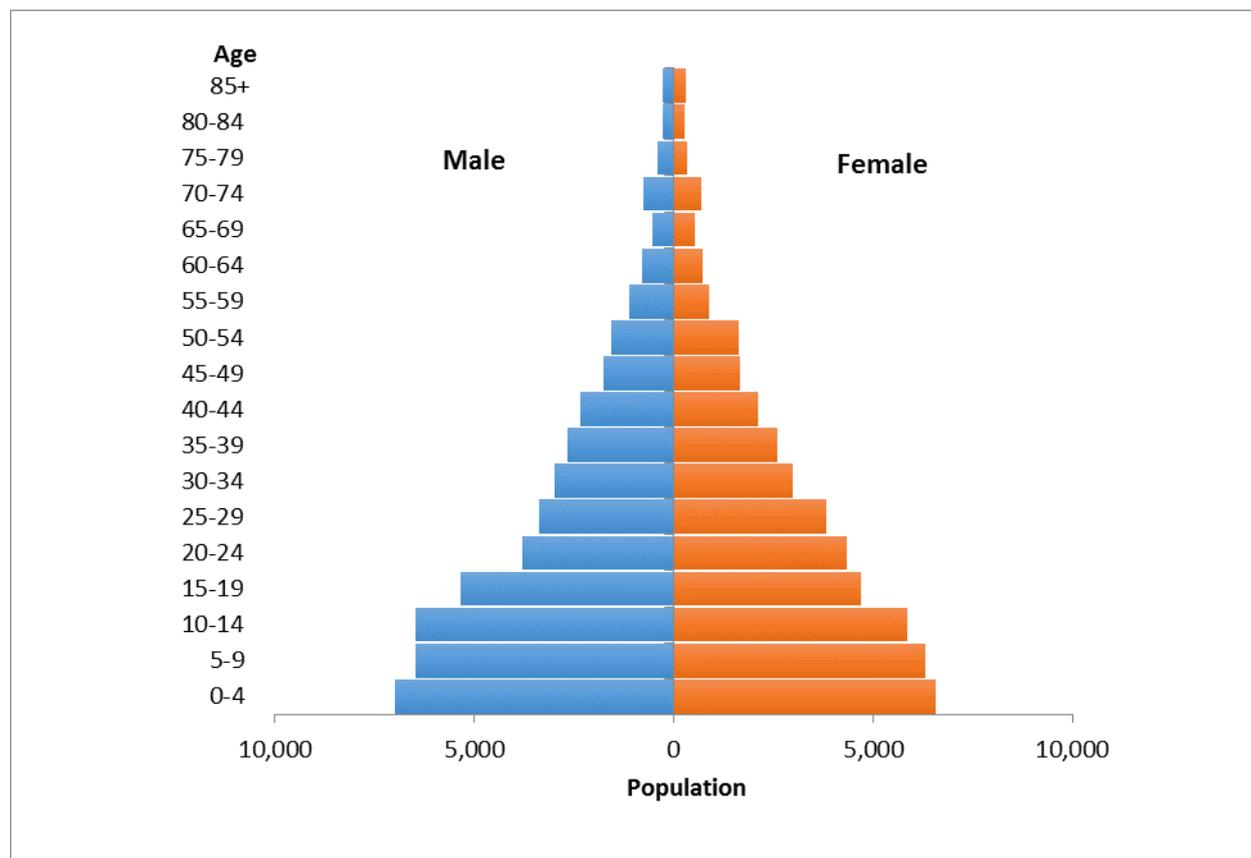

Age Group	Population						Sex ratio	Type of locality			
	Both Sex		Male		Female			Urban		Rural	
	Number	Percent	Number	Percent	Number	Percent		Number	Percent	Number	Percent
All Ages	94,285	100.0	47,956	100.0	46,329	100.0	103.5	17,758	100.0	76,527	100.0
0 - 4	13,570	14.4	6,993	14.6	6,577	14.2	106.3	2,219	12.5	11,351	14.8
5-9	12,788	13.6	6,473	13.5	6,315	13.6	102.5	2,107	11.9	10,681	14.0
10-14	12,337	13.1	6,485	13.5	5,852	12.6	110.8	2,215	12.5	10,122	13.2
15 - 19	10,046	10.8	5,353	11.2	4,693	10.3	114.1	2,198	12.4	7,848	10.3
20 - 24	8,155	8.6	3,801	7.9	4,354	9.4	87.3	1,850	10.4	6,305	8.2
25 - 29	7,182	7.6	3,363	7.0	3,819	8.4	88.1	1,479	8.3	5,703	7.5
30 - 34	5,978	6.3	2,993	6.2	2,985	6.4	100.3	1,169	6.6	4,809	6.3
35 - 39	5,265	5.6	2,659	5.5	2,606	5.6	102.0	984	5.5	4,281	5.6
40 - 44	4,451	4.7	2,345	4.9	2,106	4.5	111.3	828	4.7	3,623	4.6
45 - 49	3,415	3.6	1,757	3.7	1,658	3.6	106.0	670	3.8	2,745	3.6
50 - 54	3,198	3.4	1,554	3.2	1,644	3.5	94.5	574	3.2	2,624	3.4
55 - 59	1,989	2.1	1,101	2.3	888	1.9	124.0	398	2.2	1,591	2.1

## 2.3 Age-Sex Structure

As depicted in Figure 2.1 the district has a youthful population, consisting of a large proportion of children under 15 years (41%), and a small proportion (4.7%) of elderly persons (65 years & older). The sex-ratio of 103.5 for the district indicates that there are more males than females.

**Figure 2.1: Population pyramid by age and sex structure**

Source: Ghana Statistical Service, 2010 Population and Housing Census

The age structure of the population is based on the effects of fertility and mortality. Figure 2.1 shows the age-sex structure with respect to Ahafo North District. It has a broad-base and narrow top population pyramid. This shows that except the 70-74 age cohorts and the male component of age cohort 10-14, the population within every age cohort is lower than the cohort just preceding it given it a conical shape. This is a typical shape for the population of a developing country. The male population dominates the females in almost all the age cohorts. The population reduces with an increase in age but at age 70-74 the figure becomes higher than the preceding figure and then declined again.

### 2.3.1 Age dependency ratio

The relationship between the populations aged 0-14 years and 65 years and above and the population aged 15-64 years constitute age dependency, measured per 100 working age populations. The age-dependency ratio by sex in the district is presented in Table 2.2. There is a relatively high age dependency ratio in the district (84.2 persons per 100 of the population). This means that at least every one person within the working age group has about one person in the dependent age group to care for. The table further indicates that the child dependency ratio of 80 is higher than the old age dependency ratio of 12. Meaning

every ten working age persons cater for 8 children. In terms of old age every ten working age persons work to cater for about one old age person. In terms of sex the male dependent ratio of 89 was slightly higher than the female dependency ratio of 85 in the district.

In the urban areas the dependency ratio is 83 whilst it is 89 in the rural areas. This means the dependency ratio in the rural areas is higher than the urban areas in the district.

From Table 2.1, nearly half (45.7%) of the population in the district constitute the economically not active population. There was higher age dependency ratio in the rural areas (87.7%) compared with urban areas (70.5%). The age dependency ratio tends to be higher among the males (86.4) than among the females (81.9). This means that the people do not have excess money to save towards future investment.

**Table 2.2: Age dependency ratio by sex and type of locality**

Age Group	Population			Type of locality	
	Both Sexes	Male	Female	Urban	Rural
All Ages	94,285	47,956	46,329	17,758	76,527
0-14	38,695	19,951	18,744	6,541	32,154
15-64	51,193	25,725	25,468	10,413	40,780
65+	4,397	2,280	2,117	804	3,593
Age-dependency ratio	84.18	86.42	81.91	70.54	87.66

Source: Ghana Statistical Service, 2010 Population and Housing Census

## 2.4 Fertility, Mortality and Migration

The changes in population are as a result of fertility, mortality and migration. High fertility rates coupled with low mortality rates results in high population. To determine how the demography of the district will change, it is important to know the migration, fertility and mortality patterns.

### Fertility

The natural growth of a population is dependent on lifetime fertility and current fertility. Lifetime fertility refers to the total number of live births that females 12 years and older had ever had during their lifetime. Current fertility refers to the number of live births that females 12 - 54 years old had during the 12 months preceding the census night. Table 2.3 shows Reported total fertility rate, general fertility rate and crude birth rate for the district and the regional values. The data indicates that the total fertility rate (TFR) for the district is at 3.9, significantly higher than the regional value of 3.3. The general fertility rate (GFR) for the district is 118.6 per 1000, and that for the region is 96.4 per 1000. Also the crude birth rate (CBR) for the district is 28.0 whereas the figure for the region 25.7. Similarly the reported figure for the number of births in last 12 months is 2,636 for the district and 122,878 for the region.

As shown in Table 2.3. The crude birth rate is 28.0 per 1,000 while the general fertility rate for the district is 118.6 per 1,000.

**Table 2.3: Reported total fertility rate, general fertility rate and crude birth rate**

District	Population	Number of women 15-49 years	Number of births in last 12 months	Total Fertility Rate	*General Fertility Rate	**Crude Birth Rate

Source: Computed from the 2010 Population and Housing Census

Note: \*Number of live births per 1,000 women aged 15-49 years

\*\* Number of live births per 1,000 population

Figure 2.1 shows the average child per woman. The data in figure 2.1 shows that the average child per woman increases with advancing age groups in the district. Thus the average child ever born for female age group 60 years and older is 6.9. However it decreases persistently to less than 1.0 for age group 20-24 and below. The persistent decrease in number of children ever born may be explained by a number of factors such as improvements in healthcare, increased cost of bringing up children, education of women, which prolong the age at which child bearing begins and the realisation by many parents for quality as against quantity. This trend is similar to the national pattern. The future implication for the district is a reduced growth rate if this trend of reduced fertility continues and mortality levels also stay low.

**Figure 2.2: Average child per woman**

Source: Ghana Statistical Service, 2010 Population and Housing Census

### **Children ever born and surviving**

Table 2.4 below shows that female population sixty years and above has majority of both children ever born (19,645) and children surviving (15,307) as compared to the other age groups. From the table, apart from the age group 15-19, there are more male children ever born to women in all the other age groups than females. In terms of children surviving, there are more male children surviving than female children surviving in all the age groups except for age groups 20-24 and 25-29, which have more female children surviving than males.

**Table 2.4: Female population 12 years and older by age, children ever born, average children per woman children surviving and sex of child**

Age	Number of Female	Children Ever Born			Average Children per Woman	Children Surviving

## 2.5 Mortality

Mortality rate is a measure of the number of deaths (in general, or due to a specific cause) in a population, scaled to the size of that population, per unit of time. Mortality rate is typically expressed in units of deaths per 1,000 individuals per year; thus, a mortality rate of 9.5 (out of 1,000) in a population of 1,000 would mean 9.5 deaths per year in that entire population. The term "mortality" is also sometimes though not quite appropriate used to refer to the number of deaths among a set of diagnosed hospital cases for a disease or injury, rather than for the general population of a country or ethnic group

Analysis of mortality is very important as it is one of the determinants of population in any country. Table 2.5 indicates that a total of 472 household deaths occurred in the district compared to 27,948 household deaths recorded in the region. The death in the district accounted for only 1.7% of the total deaths in the region.

The data also show that the crude death rate for the district is pegged 5.01 per 1000, as against the value of 5.8 per 1000 for the region.

**Table 2.5: Total Population, deaths in households and crude death rate**

District	Total Population	Deaths in households	*Crude death rate

### Cause of death

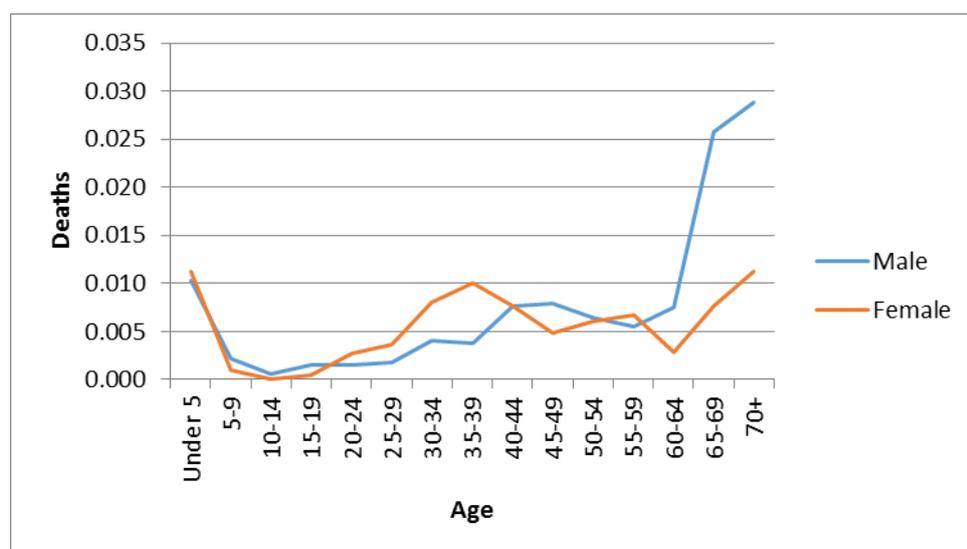

Cause of death is defined as an official determination of conditions resulting in a person's death. In modern times, such a determination usually is essential data on a governmental death certificate. Table 2.6: indicates Cause of death by district. The table considered only two possible causes of death namely, Accident/violence/homicide/suicide and all other causes of death. From the data out of the total deaths of 472 recorded over 12 months preceding the census night for the Ahafo Ano North district, Accident/violence/homicide/suicide accounted for 11.9% of all deaths in the district which was same as the rate recorded at the regional level. Eighty nine percent of the deaths were due to other causes rather than accident/violence/homicide/suicide according to Table 2.6.

**Table 2.6: Cause of death by district**

Region/District	Total deaths	Death due to			
		Accident/violence/homicide/suicide		All other causes	
		Deaths	Percent	Deaths	Percent
All District	27,948	3,329	11.9	24,619	88.1

**Figure 2.3: Age specific death rates**

Source: Ghana Statistical Service, 2010 Population and Housing Census

Table 2.7 indicates that under-five mortality recorded nearly 31 percent of all deaths for the 12 months preceding the census night. In terms of sex differences deaths among males were slightly higher than females. Whereas male deaths alone accounted for 53 percent, that of female constituted 47 percent of all deaths in the district.

The numbers of females who died 12 months preceding the census night surpassed are larger than those for males between 20 and 39 years. As shown in Figure 2.3 there is a substantial difference between the percentage of the male deaths (64 years and older) and that of females aged 64 years and older in the district. Male aged deaths tend to be higher than that of their female counterparts. The reverse is the case for age between 40 years and 54 years where the proportion of male deaths is higher than that of the female deaths.

**Table 2.7: Population by Age and deceased person by sex**

Age group	Sex of Population			Sex of deceased person		
	Total	Male	Female	Total	Male	Female

### **2.4.1 Migration**

Migration is the movement by people from one place to another with the intention of settling in the new locality. The People involved in this movement either choose to move on their own volition (voluntary migration) or are forced or compelled to move (involuntary migration). Migration is as old as human history.

It is usually defined as any form of geographic or spatial movement which usually results in a change of place of usual residence, the movement is usually between clearly defined geographic units i.e. place of birth and current place of residence. The movement is usually over long distances and normally from one country to another referred to in international migration or from one locality in a country to another locality in the same country but possibly in a different region this is referred to as internal migration which is also more frequent. Migration could be by individuals, family units or in large groups.

The questions on migration in the 2010 PHC included place of birth, duration of residence, emigration and nationality. On the basis of the answers to the place of birth question, migrants are defined as persons who were enumerated in a different place from where they were born, while non-migrants were persons who were enumerated in the place they were born.

Table 2.8 shows that 43.1 percent (40,633) of the district population are migrants. Out of the total migrant population of 40,633, nearly half of the migrants (45%) were born elsewhere in the region (18,301). The data also show that there are migrants from Upper East (17.1%), who constitute the highest proportion of the migrants born elsewhere from another region those from Brong Ahafo region constitutes the next highest proportion of (10.5%) and Northern (9%) with migrants from Greater Accra (1.4%) region having the lowest proportion. The higher proportion of the migrants from Upper East may be attributed to the prevalence of cocoa farms in the district where most of them are employed as caretakers.

Further analysis of Table 2.8 indicates that more than half of the migrants from all the regions except Western region, Greater Accra and those from outside Ghana have stayed in the district for more than five years.

Migrants from the three northern regions of Ghana constitute 29 percent of all the migrants in the district.

**Table 2.8: Birthplace by duration of residence of migrants**

Birthplace	Number	Duration of residence (%)				
		Less than 1 year	1-4 years	5-9 years	10-19 years	20+ years
Total	40,633	12.9	27.7	19.5	18.4	21.5

## CHAPTER THREE

### SOCIAL CHARACTERISTICS

#### 3.1 Introduction

The size, composition, and structure of households are influenced by socio-economic, and demographic factors such as age at first marriage and birth, length of time spent in school, cultural practices, occupation, material or financial abilities, capabilities of parents and couples, fertility and mortality rates, and migration. The total size of the district population and its characteristics are largely a reflection of what pertains within households. For example, knowledge of household structure, composition, and headship provides important statistical tool for social and economic planning. A study of households also provides the basis for a reasonable projection of the future size of population, and planning of housing needs.

This chapter looks at the size of the household population and its composition, relationship of household heads to the other members, marital status and nationality of the people. It also looks at the religious affiliation as well as literacy and education of the population.

#### 3.2 Household Size and Composition

Households constitute important units in planning for goods and services. According to 2010 population and Housing census a total of 92,924 household population was enumerated in 20,994 households living in 14, 819 houses in the district. The average households per house is 1.4 for the district and 2 for the region, it is 16 at the national level. The population per house is 6.3 for the district and 8.1 at the regional level.

##### Household size

The average household size is 4.4 for the district and 4.1 at the regional level and also 4.4 at the national level. In term of type of locality urban household population is 17,381 and that for the rural localities is 75,543. Households in the urban areas is 4,712 and in the rural areas is 16,282. Average households per house is 2.3 in the urban areas and 1.3 in the rural areas. Similarly average population per house is 8.6 in the urban areas and 5.9 in the rural areas whilst the average household size is 3.7 in the urban areas and 4.6 in the rural areas.

**Table 3.1: Household size by locality**

Categories	Total				
	country	Region	District	Urban	Rural
Total household population	24,076,327	4,671,982	92,924	17,381	75,543

### 3.2.1 Household composition

Table 3.2 shows the Household population by composition and sex. The data indicates that Out of the total households population of (92,924), about 47,368 or 51 percent are males with 45,556 or 49 percent households being females. Also 22.6 percent of the household population are heads, while 11.4 percent are spouses. Almost half of the household population are children (44.5%) while 2.5 percent constitute non-blood relation. Among the male households household population heads constitute 32.1 percent compared to 12.7 percent female heads among the female household population. Females are predominantly spouse of heads (22.6%) as against male spouse of (0.7%). There are more daughters in law (0.8%) in the households than sons (0.2%) in law.

**Table 3.2: Household population by composition and sex**

Household composition	Total		Male		Female	
	Number	Percent	Number	Percent	Number	Percent

Source: Ghana Statistical Service, 2010 Population and Housing Census

### 3.2.2 Household population by structure

Table 3.2 shows Household population by structure and sex. The data indicates that single person households constitute 3.8% of the total household population in the district. From the data among the male household population heads only constitute 5.6 percent compared to a corresponding 1.9 percent for females among the female household population. Heads and spouse only constituted 1.9 percent and Nuclear (Head, spouse(s) and children) constitutes 32 percent followed by extended (Head, spouse(s), children and Head's relatives) 24 percent. also single parent Nuclear constitutes 9.5 percent of the household population, whilst single parent extended constitutes 12.9 percent. in terms of sex Nuclear (Head, spouse(s) and children) constitutes 32.8 percent of the male household population and Extended (Head, spouse(s), children and Head's relatives) constitutes 24.0 percent whilst single parent extended constitutes 10.7 percent. Among the female Nuclear (Head, spouse(s) and children) constitutes 31.1 percent and Extended (Head, spouse(s), children and Head's relatives) constitutes 24.2 percent whilst single parent nuclear is 8.2 percent among the male it is 10.8 percent among the female. There are more female single parents than male.

The analysis above gives a clear indication that Ghanaians are fast moving away from the extended family system and taking up to the nuclear family system. This assertion notwithstanding the extended family system still has a strong presence.

**Table 3.3: Household population by structure and sex**

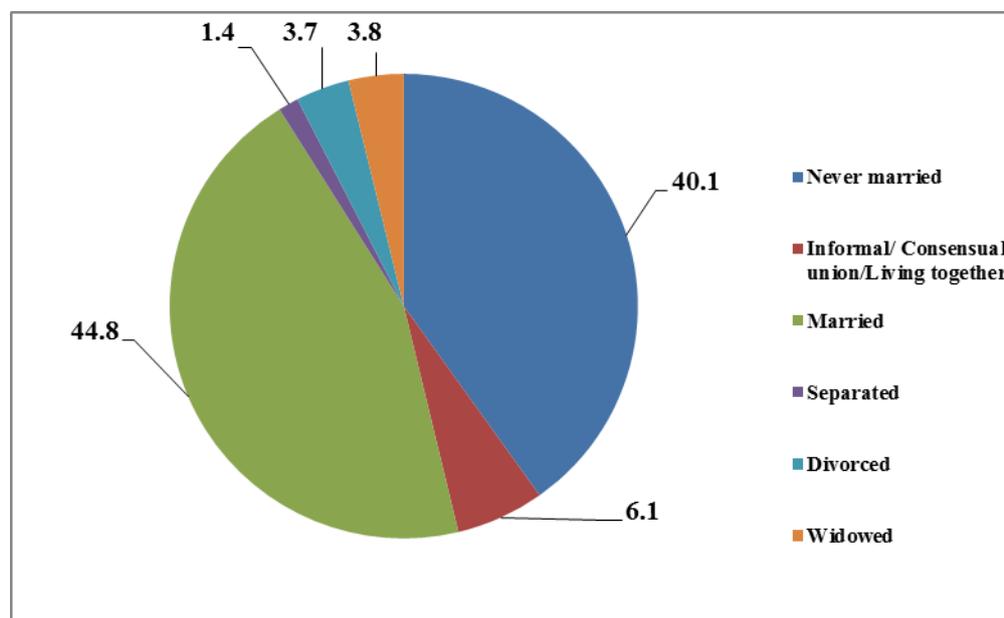

Household structure	Total		Male		Female	
	Number	Percent	Number	Percent	Number	Percent
Total	92,924	100.0	47,368	100.0	45,556	100.0
Head only	3,532	3.8	2,650	5.6	822	1.9

### 3.3 Marital Status

Figure 3.1 shows the population 12 years and older by marital status the district. The data indicates that almost half of the population 12 years and older were reported to have married (44.8%) while 8.9 percent have been married before but for reasons such as divorce (3.7%), separation (1.4%) and widowed (3.8) are no longer in marriage. the population that reported never married is 40.1 percent.

**Figure 3.1: Persons 12 years and older by marital status**

Source: Ghana Statistical Service, 2010 Population and Housing Census.

### 3.4 Marital Status by Age and Sex

Table 3.6 shows the Persons 12 years and older by sex, age-group and marital status. Almost half of the male population have never been married (46.7%) compared to the 33.4% of female population (Table 3.3). Females are more likely to be in consensual/ informal union (7%) compared to males (5.3%). Five out of every 10 females aged 65 years are widowed compared to 8.1 percent of males in the same age bracket. The age cohort with the highest

concentration of never married is the 5-9. whilst the married have their highest concentration 67 percent in the age cohort 40-49. the age group with the highest number of the separated is 50-54 whilst the widowed have their highest concentration in the 65+ age cohort. In terms of sex about 46.7 percent of the male have never married and 43.1 percent are married with 5.3 in consensual union. In the case of the female 33.4 percent are never married and 46.5 are married with 7.0 percent in consensual union. There are more widowed female in the age brackets of 50-54 (13.7%), 55-60 (21.4%), 60-64 (26.3%) and 65 and above (50%) than their male counterpart who recorded 1.5, 1.8, 2.8 and 8.1 respectively. A phenomenon worth noting is this incidence of high percentage of the female population aged 50 years and above widowed, as against their male counterparts within the same age grouping. This could be an indication of the tendency of male widowers to re-marry or as a result of the cultural practice where the male could marry more than one woman, this means a man with three wives, losing one of them will not identify himself as a widower in any study like this even though he may admit having lost a wife, but the presence of other wives will make him not to identify himself as a widow. Whereas the death of that man will render three women widows.

### 3.3.1 Marital status and level of education

The marital status of persons 12 years and older by sex, and level of education is presented in Table 3.4. The data indicates that of the total population 12 years and older in the district 29.4 percent have no education, 57.2 percent have basic education 9.3 percent have secondary education, those with vocational technical or commercial education are 0.8 percent whilst post middle/secondary /diploma constitutes 2.7percent and those with tertiary education constitutes the least of 0.6 percent. Among the married 47.9 percent have basic education as against 42.6 percent who have no education. However those who have tertiary education constitute (0.8%). In addition among those who are never married, 70.2 percent have basic education, and 15.7 percent have secondary education whilst only 0.5 percent have tertiary education.

The table also shows the sex differentials by marital status. Among the married male population in the municipality, 47.9 percent have basic education, 42.6 percent have no education and 0.5 percent have tertiary education. On the other hand, among the married females 46.3 percent have basic education, 47.8 have no education and only 0.2 percent have tertiary education. Also 71.1 percent of females never married have basic education and 9.0 percent had no education. It could be noted that the proportion of married males in tertiary education (0.8%) is higher than that of females (0.2%).

### 3.3.2 Marital status and economic activity status.

Table 3.5 persons 12 years and older by sex, marital status and economic activity status. This section takes a look at the population 12 years and older, their marital status and economic activity status. Table 3.4 shows persons 12 years and older by sex, marital status and economic activity status. The data indicates that out of the total population of 62,662 who are aged 12 years and older in the district 61.9 percent are employed and 2.7 percent are unemployed whilst 35.4 percent are economically not-active. Among the never married 29.3 percent are employed and 3.8 are unemployed whilst 66.9 are economically not-active

In terms of sex, among the married male 91.3 percent are employed, 1.0 percent of them are unemployed whilst 7.7 percent are economically not-active. Similarly among the married females 81.1 percent are employed and 2.6 percent are unemployed, whilst 16.3 percent are economically not active.

As shown in table 3.4, generally the proportion of economically not active is high (above 60%) among the population who have never married.

**Table 3.5: Persons 12 years and older by sex, marital status and economic activity status**

Sex/marital status	All status		Employed		Unemployed		Economically not active

### 3.4 Nationality

Majority of the population in the district are Ghanaians. Table 3.4 shows the Population by nationality and sexing the district. The data according to 2010 PHC show that 97.9 percent of the district population are Ghanaians while 2.1 percent are non- Ghanaians. Majority of the

population are Ghanaians by birth (95.1%). Persons with dual nationality constitute 2.1 percent while Ghanaians by naturalization make up 0.7 percent. The proportion of male non-Ghanaians (2.2%) is slightly higher than female non-Ghanaians (2%). ECOWAS nationals constitute the highest proportion of the non-Ghanaian population (1.3%) while other African nationals make up 0.5 percent.

**Table 3.4: Population by nationality and sex**

Nationality	Both sexes		Male		Female	
	Number	Percent	Number	Percent	Number	Percent

### 3.5 Religious Affiliation

Table 3.5 shows the Population by religion and sex in the district. The data indicates that more than two thirds of the population (68.6%) are Christians (Catholic, Protestant, Pentecostal/Charismatic and other Christians) followed by Islam (22.3%). In all the types of religion there is higher proportion of females than males except Islam and Traditionalists where males predominate. The population with no religion in the district forms 8 percent with a higher percentage of males (10.2%) than females (5.7%)

**Table 3.5: Population by religion and sex**

Religion	Both sexes		Male		Female

### 3.6 Literacy and Education

#### 3.6.1 Literacy

The 2010 PHC collected data on literacy status of the population aged 11 years and older. Figure 3.2 shows the Population 11 years and older by literacy status. The data indicates that the literate population 46,342 in the district constitutes 71.4 percent of the population 11 years and older (64,878). Figure 3.2 shows the distribution of the population according to the

language in which they were literate. It shows that 15.1 percent of the population were literate in English only, 14.3 percent in Ghanaian language only and 70.2 percent in English and Ghanaian language. Those literate in English and French or English French and Ghanaian language were just a few each recording 0.2 percent.

**Figure 3.2: Population 11 years and older by literacy status**

Source: Ghana Statistical Service, 2010 Population and Housing Census

Table 3.6 shows the population 11 years and older by sex, age and literacy status. The data indicates that the age cohort 11-14 had the highest proportion of 19.8 percent literate persons in English only. In addition 14.1 percent of them are literate in Ghanaian language only and 65.8 percent of them are literate in English and Ghanaian language. In terms of sex that age cohort among the male had the highest proportion 19.8 percent of literate in English only, 13.8 percent in Ghanaian language only and 66.5 percent in English and Ghanaian language. Among the females this age cohort recorded 20.4 percent in English only, 14.4 percent in Ghanaian language only, and 64.9 percent in English and Ghanaian language.

The data further shows that a higher proportion of the population in all the age groups can read, write and understand English and Ghanaian language more than in English only and Ghanaian language only.

Those who can read, write, understand English, French and Ghanaian language in the district account for less than one percent in all the age groups for both sexes. Comparatively there are more literate males than literate females in the district 54.6 percent compared with 45.4 percent.

**Table 3.6: Population 11 years and older by sex, age and literacy status**

### 3.6.2 Education

Education is an important aspect of societal development. It is the process of acquiring knowledge, skills, values and attitudes to fully develop individual capacities for societal well-being. There is a relationship between education, human resource development and economic growth (United Nations Development Programme, 2011).

#### School Attendance

School attendance by the 2010 PHC refers to a full time education in an educational institution. By this we are referring to a Nursery or Kindergarten for Pre-school, Primary, Middle, Junior Secondary or Junior High Secondary School, for Basic school, or Senior Secondary, a Teacher training institution or a University or an analogous type of school where a person can receive general education in which the emphasis of the educational training is not on any vocation, skill or trade.

The 2010 PHC sought for information on whether persons 3 years and older have ever attended school in the past, currently attending or have never attended school. Figure 3.2 shows Population 3 years and older by school attendance and sex.

The data indicates that there are 85,990 persons 3 years and older in the district with 43,629 (50.7%) being males whilst 42,361 (49.3%) are females. Out of this total number 24.8 percent has never attended school, 33.5 percent attended school in the past, whilst 41.7 percent are currently attending school.

In terms of sex, among the male population of 43,629 who are 3 years and older 20.8 percent has never attended school and 35.7 attended school in the past, whilst 43.5 percent are currently in school. Similarly among the female 28.9 percent never attended school, but 31.2 percent attended in the past and 39.9 are currently in school.

**Figure 3.3: Population 3 years and older by school attendance and sex**

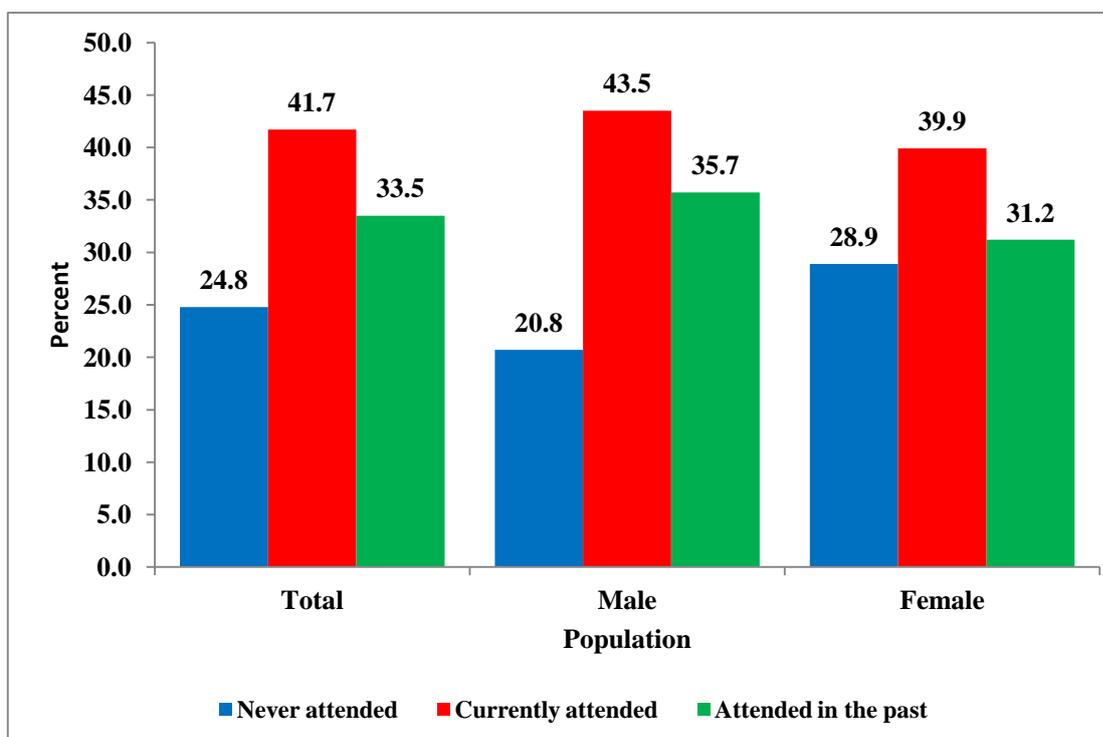

Table 3.7 shows that 29.4 percent of the district population has no formal education. The data show that married persons 12 years and older with basic education forms almost half (47.9%) of the married population. More than one third (42.6%) of the persons 12 years and older who are married have no education in the district. Within the married population the proportion of persons decreases with higher levels of education in the district except married persons with post middle/secondary certificate/diploma education (2.7%) where a noticeable increase in percentage was reported. There are more non- literates than literates for females from age group 55 years and beyond. However the same pattern cannot be said of the males as the only age group where there are more non- literates than literates is at 65years and older.

According to the 2010 PHC data the total number of people currently attending school is 35,885 as shown in table 3.7. This is twice as much as the number who attended in the past (15,597). Males who attended middle school in the past (30.5%) is higher compared to females (23.5%). Females currently attending primary school (52.3%) are slightly of a higher proportion than males (50.7%). Currently only 0.4 percent of the female population 3 years and older are in tertiary school as against 1.0 percent males.

**Table 3.7: Population 3 years and older by level of education, school attendance and sex**

# CHAPTER FOUR

## ECONOMIC CHARACTERISTICS

### 4.1 Introduction

The quality of life in society depends to a large extent on how that society harnesses, trains and equips its human resources to exploit and manage its stock of human and physical resources. Therefore an understanding of the structure and dynamics of the labour force is critical for the development of the district.

In this chapter, information on the activity status, size and structure of the labour force and its distribution by occupation, industry, sector of employment and unemployment status have been analysed.

### 4.2 Economic Activity Status

The economically active population comprises all persons of either sex who provide the supply of labour during a specified time reference period, as employed or as unemployed, for the production of economic goods and services. The activity status of a person is determined over a short reference period such as a week (preferred option) usually indicating employed, unemployed or economically not-active during the reference period. Figure 4.1 shows Population 15 years and older by economic activity status in the Ahafo Ano North district. The data indicates that in the District, 72.1 percent or about 7 out of every ten people aged 15 years or older is economically active and about 27.9 percent of the people are economically not-active.

**Figure 4.1: Population 15 years and older by economic activity status**

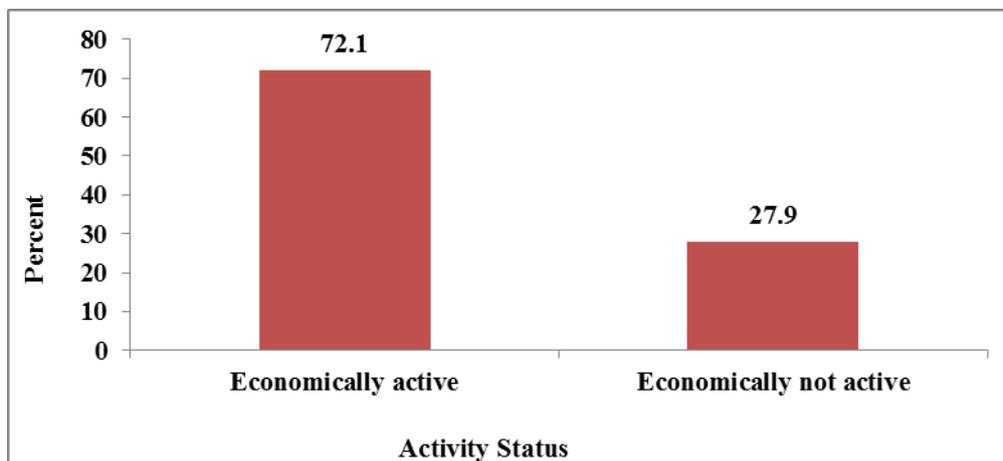

Table 4.1 presents the population 15 years and older by sex and activity status in the district. Of the total population of 55,590 aged 15 years and older, 72.1 percent are reported to be economically active with 27.9 percent being economically not active. Within the economically active population, of 40106 the data indicates that 95.7 percent are employed in the district as against 4.3 percent who are unemployed. The proportion of males who are economically active (74.4%) is slightly higher than that of females (69.8%). The proportion of the unemployed females (4.8%) is higher than that of their male counterparts (3.8%). It is worth noting that the

employed population and the unemployed combine to form the economically active population.

**Table 4.1: Population 15 years and older by activity status and sex**

Activity status	Total		Male		Female	
	Number	Percent	Number	Percent	Number	Percent
Total	55,590	100.0	28,005	100.0	27,585	100.0
Economically active	40,106	72.1	20,842	74.4	19,264	69.8

Other	1,017	6.6	460	6.4	557	6.7

Source: Ghana Statistical Service, 2010 Population and Housing Census

From Table 4.2 it could be observed that with regard to the unemployed population in the district, about 79 percent are found between ages 15 years and 29 years

A little over half (50.4%) of the economically not active population are found in age group 15-19 years followed by 20-24 age group which accounts for nearly 20 percent. Among the economically not active population a large percentage of them are more likely to be students since the age groups where higher proportions of this population are found coincide with secondary and post-secondary school going age. There is a decrease in percentages of employed population from one age group to another.

Among the economically not active population, those within the age bracket of 15-29 contribute about 77 percent. This is actually expected since the age bracket coincides with school going age. In terms of sex the employed male population constitutes about 52.2 percent (20,060) of the, employed population whilst the female constitutes (47.8). The age cohort with the highest proportion of the employed is the 25-30 with 14.2 percent followed by 30-34 years with 14.0 percent. In terms of the female the highest contribution comes from the age cohort 25-29 with 15.7 percent followed by age cohort 30-34 with 13.7 percent.

### 4.3 Occupation

Table 4.3 shows that a greater proportion (69.2%) of the employed population 15 years and older is engaged in skilled agricultural forestry and fishery. About 18 percent are engaged in white-collar jobs (managers, professionals, technicians and associate professionals, clerical support workers and service and sales workers).

The data from Table 4.3 indicate that females dominate in service and sales (20.5%) compared to males (3.6%). On the contrary, males (5.4%) substantially dominate in plant and machines assembly occupation compared to females (0.7%). A proportion of females (3.4%) are reported to be in elementary occupations compared to their male counterparts (2.1%).

**Table 4.3: Employed population 15 years and older by occupation and sex**

Occupation	Both sexes		Male		Female	
	Number	Percent	Number	Percent	Number	Percent
Total	38,397	100.0	20,060	100.0	18,337	100.0

#### 4.4 Industry

Table 4.4 presents data on employed population 15 years and older by industry and sex. The dominant industry in the district which is agriculture employs nearly 70 percent of the labour force followed by wholesale and retail trade which employs 9.7 percent of the work force. It is significant to note that there are no real estate, extraterritorial organisations and bodies activities in the district. The data also show that females tend to be more engaged in wholesale and retail service, manufacturing, accommodation and food services than their male counterparts. Construction and transportation industry on the other hand tend to be dominated by males (2.3% and 2.7% respectively) than females (0.0% and 0.1% respectively).

**Table 4.4: Employed population 15 years and older by Industry and Sex**

Industry	Both sexes		Male		Female	
	Number	Percent	Number	Percent	Number	Percent

## 4.5 Employment Status

Table 4.5 shows that nearly two thirds (65.2%) of the employed population 15 years and older, are self-employed without employees, whereas 12.7 percent are contributing to family work. Male employees (15.7%) are significantly higher compared to female employees (7.4%) in the district. The predominance of female as homemakers is reflected in higher proportion of females (18.4%) who do domestic work as against a low proportion of males (7.6%). Males (5.3%) dominate in the field of casual work compared to their female counterparts (2.2%). The proportion of male employees (15.7%) within the district is twice that of the females (7.4%). There is no difference between females and males who are self-employed without employees in the district.

**Table 4.5: Population 15 years and older by employment status and sex**

Employment Status	Both sexes		Male		Female	
	Number	Percent	Number	Percent	Number	Percent
Total	38,397	100.0	20,060	100.0	18,337	100.0
Employee	4,522	11.8	3,158	15.7	1,364	7.4

## 4.6 Employment Sector

Table 4.6 presents data on employed population 15 years and older by employment sector and sex. Of the employed population 15 years and older, the private informal and formal sectors employ a higher proportion of the labour force (94.3%) with public sector employees accounting for only 5.4 percent. Non-governmental organisations and semi-public/parastatal sector absorb the remaining percentage (0.4%). None of the labour force is involved in other international organisations activities in the district.

In all employment sectors, males tend to dominate except private informal where females have a higher proportion (95.1%) than their male counterparts (89.7%).

Figure 4.3 illustrates that private informal sector alone employs a significant proportion (92.3%) of the working population in the district.

The large number of people in the private informal compared to the private formal could be attributed to the flexibility in setting up the former. Another reason could be the lack of paperwork involved in setting up the private informal.

**Table 4.6: Employed population 15 years and older by employment sector and sex**

Employment Sector	Both sexes		Male		Female	
	Number	Percent	Number	Percent	Number	Percent
Total	38,397	100.0	20,060	100.0	18,337	100.0

# CHAPTER FIVE

## INFORMATION COMMUNICATION TECHNOLOGY

### 5.1 Introduction

The information communication technology (ICT) industry in Ghana has witnessed rapid expansion over the last decade, generating job opportunities and promoting competitive environment for economic growth of the country. The district, like the rest of the country, has all the four major telecom companies, namely Vodafone, MTN, Tigo and Airtel.

This chapter presents indicators on information communication technology, notably ownership of mobile phone, usage of internet and households having desktop/laptop computers.

### 5.2 Ownership of Mobile Phones

Access to information is fast becoming a necessary pre-requisite for living a meaningful life in the district. Table 5.1 shows the Population 12 years and older by mobile phone ownership, internet facility usage, and sex.

Analysis of Table 5.1 depicts that the out of the population 12 years and older in the Ahafo Ano District of 62,662 there are 31,731 males which constitutes (50.6%) and 30,931 females which also constitutes (49.4%). About one third (33.1%) of the total population own mobile phones. This is greater than the regional figure of 23.1percent and less than the national figure (47.7%). Among the male population 38.3 percent have mobile phones compared with 27.8 percent for females. Thus percentage of females owning mobile phones is less than that of the males in the district.

**Table 5.1: Population 12 years and older by mobile phone ownership, internet facility usage, and Sex**

Sex	Number	Percent	Population having mobile phone		Population using internet facility	
			Number	Percent	Number	Percent
Total	62,662	100.0	20,724	33.1	856	1.4
Male	31,731	100.0	12,124	38.3	566	1.8
Female	30,931	100.0	8,600	27.8	290	0.9

Source: Ghana Statistical Service, 2010 Population and Housing Census

### 5.3 Use of Internet

Internet access and usage in the district has been growing in recent times. It has become a very useful communication facility for people, businesses and organizations.

Of the district population 12 years and older using the internet facility, Table 5.1 shows that only 1.4 percent of the district population use the internet facilities in the district. It is seen that 1.8 percent and 0.9 percent of males and females respectively use the internet,

## 5.4 Household ownership of desktop/laptop computers by sex of head

Table 5.2 shows the proportion of households having desktop/laptop computers by sex of the head. As shown in Table 5.2 only 2.6 percent of the 20,994 households in the district own a desktop/laptop computer, that is, out of 20,994 households in the district only 554 (2.6%) households are reported to own a laptop or a desktop computer. Figure 5.2 indicates that the number of male headed households (15,194) who possess laptop or desktop computers 444 (2.9%) is substantially higher than the number of female headed households 110 (1.9%). This situation is just too bad for the development of the district in view of the hidden potential inherent in the use of the computers and the internet.

The low patronage of fixed telephone lines in the district by majority of households may be due to advent of mobile phones. People no longer see the need to own fixed telephone as mobile phones provide them the flexibility and the convenience needed for their day to activities. With regards to low access to internet facilities by most households in the district, it may be due to low electricity coverage and the expensive nature of internet facilities as well as the cost of the desk top/laptop computers in the country.

**Table 5.2: Households having desktop/laptop computers by sex of head**

Sex	Number of households		Households having desktop/laptop computers	
	Number	Percent	Number	Percent
Total	20,994	100.0	554	2.6
Male	15,194	72.4	444	2.9
Female	5,800	27.6	110	1.9

# **CHAPTER SIX**

## **DISABILITY**

### **6.1 Introduction**

Disability as defined in the 2010 Population and Housing Census are those person(s) who are unable to perform specific tasks/activities or are restricted in their performance due to loss of function of some part of the body as a result of impairment or malformation. The development of a nation depends on the contributions of not only a segment of the population but on the collective contribution of every individual, including Persons with Disabilities (PWDs). To this extent, over the past few decades there has been an international consensus on the recognition of the rights of persons with disabilities with emphasis on the promotion of their dignity, and inclusive development. Government and civil society organizations in recent years have made progress in addressing disability issues, resulting in some positive gains in improving the lives of PWDs in the country. For instance the government has enacted the Disability Act (2006), Act 715 to address issues of high poverty among PWDs due to low levels of education and lack of employable skills; inaccessibility to public transport; and unfriendly environmental facilities such as the widespread absence of ramps for PWDs to public high rise buildings and uncovered drains and gutters. The Ghana 2010 Population and Housing census is the first census in the country to have included questions on disabilities.

This chapter presents data on the prevalence of disability, type of disability, distribution by type of locality, disability and economic activity, disability, education and literacy in the Municipality. It is usually said that the most pressing issue faced by persons with disabilities is not their specific disability, but rather their lack of equitable access to resources such as education, employment, health care and social and legal support systems, resulting in persons with disabilities having high rates of poverty.

### **6.2 Population with Disability**

According to the 2010 PHC, a total of 2,224 people are reported to have various forms of disability in the Ahafo Ano North District. This represents 2.4 percent of the total population in the district. Table 6.1 shows population by type of locality, disability type and sex in the district. The data indicates that of the total PWDs, females constitute 51.1 percent (1135) while males form 48.9 percent (1089). In relation to specific disabilities of the PWDs in the district, sight related disabilities is the most common representing 45.4 percent, followed by physical (mobility) related disability 26.4 percent and hearing related disabilities (18.4%). Among the male the disability with the highest frequency is sight related 40.8 percent, followed by physical disability 27.7 percent. Similarly among the female the highest reported disability is sight related disability 49.9 percent, physical disability follows with 25.2 percent and hearing is 19.0 percent.

In terms of rural urban divide 26.3 percent of the PWDs are in the urban areas whilst 73.7 percent are in the rural areas. In terms of specific disabilities, sight is the predominant disability in both urban and rural areas it is 50.3 percent in the urban areas and 43.7percent in the rural areas. Thus almost half of the disabled population is reported to be visually impaired (45.4%) with the proportion of females with visual impairment (49.9%) higher than that of males (40.8%).

Physically challenged persons are slightly more in the urban areas (33.4%) compared to the rural areas (23.9%). It can be deduced from Table 6.1 that there is a slightly higher proportion of females suffering from both intellectual and emotional disability than the male counterpart.

**Table 6.1: Population by type of locality, disability type and sex**

### 6.3 Type of Disability

The specific type of disability includes sight, Physical (mobility), speech, intellectual emotional and any other type of observed disability not here stated. Figure 6.1 shows disability types by sex. Sight (45.4%), Physical disability (26.4%) and hearing disability (18.4%) are

some of the quite common types in the district, as one out of four PWD have a physical form of disability. This pattern is observed at both the urban and rural areas. The high percentage of population with physical disability in the district may be attributed to the prevalence of Buruli ulcer in the district. This disease (Buruli ulcer) is endemic in the district and normally deforms people.

This is worrying, since one out of every two PWD is sight impaired. Emotional and intellectual forms recorded the least figures. Female with Disability (2.4 %) are slightly higher than males (2.3%).

**Figure 6.1: Disability types by sex**

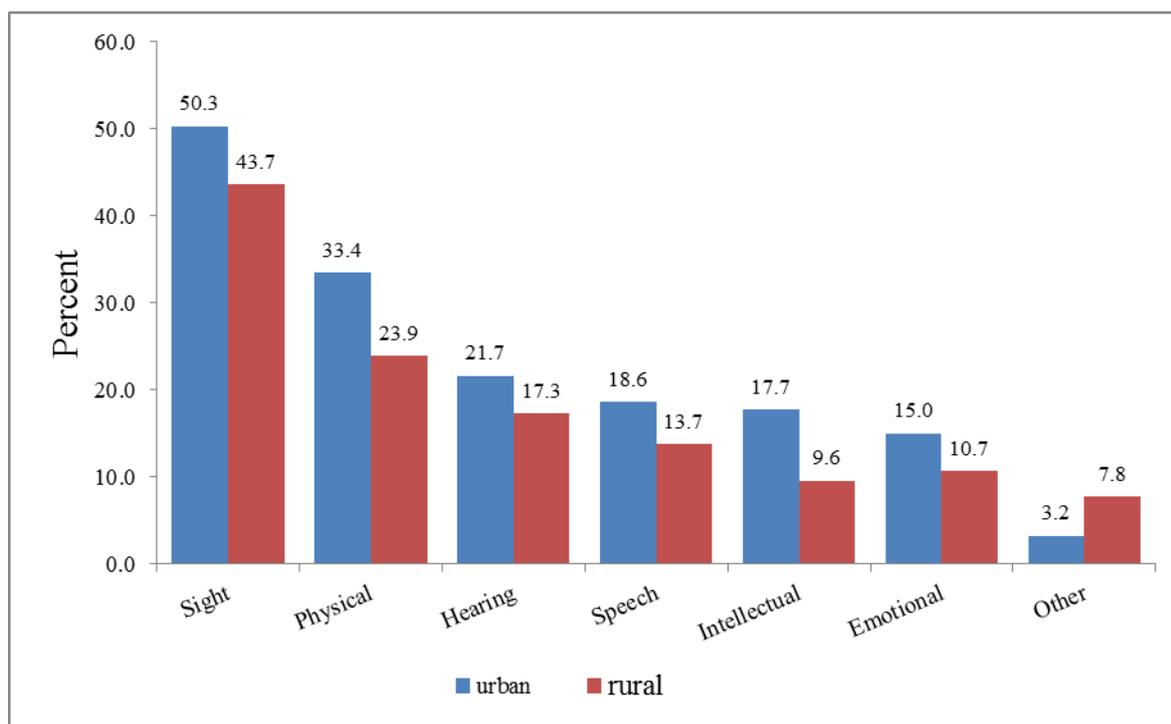

Source: Ghana Statistical Service, 2010 Population and Housing Census

#### 6.4 Distribution by Type of Locality

Figure 6.2 indicates that there are 2,224 PWDs out of which 1638 (73.7%) live in rural areas compared to 586 (26.3%) in urban areas. Figure 6.2 shows the type of disability locality type. Again, from Figures 6.2, it is clear that the proportion of PWDs in the rural areas within the district is more than those in the urban areas. Thus a noticeable proportion (73.6 %) of the PWDs lives in the rural areas within the district. This implies we have the remaining 26.4 in the urban areas. However in both urban and rural areas sight and physical (mobility) related disabilities are the most common.

**Figure 6.2: Disability by type of locality**

Source: Ghana Statistical Service, 2010 Population and Housing Census

## 6.5 Disability and Activity Status

The national figure for Economically Active PWD is 57.1 percent, while that of the region is 57 percent. Economically not active PWD is 45.7 percent for the region and 42.9 percent for the national. As shown in Table 6.2, there is a total of 1,888 persons aged 15 years and older with different forms of disabilities in the district representing 3.4 percent. Out of this number, 1,057 (55.9%) were employed, whilst 31 (1.6%) were unemployed and 803 (42.5%) are reported to be economically not active. Among the people with sight related disabilities 58.2 percent are employed with 0.4 being unemployed and 41.4 percent of them being economically not active.

In relation to sex the male with disabilities form 48.9 percent of the PWDs 15 years and older and the female constitutes the remaining 51.1 percent. Out of the number for the males 60.1 percent are employed, with 1.5 percent being unemployed and 38.4 percent are economically not-active. Similarly among the female 51.7 percent are employed and 1.7 percent are unemployed whilst 46.5 percent are economically not-active.

In relation to the specific disabilities for both male and female the proportion of economically not-active is almost all over 40 percent.

**Table 6.2: Persons 15 years and older with disability by economic activity status and sex**

## 6.6 Disability, Education and Literacy

Table 6.3 indicates Population 3 years and older by sex, disability type and level of education in the Ahafo Ano North District. The table depicts that of the 2.5 percent of persons in the district have some form of disability, out of this about 950 (43.6%) never attended school But 2.1 percent had pre-school and 46.4 percent had basic education whilst 7.9 percent had Sec./SSS/SHS and higher Among the male PWDs 3 years and above 20.7 percent never attended school but 8.6 percent had pre-school education and 58.8 percent had basic education whilst 7.9 had education up to the Sec./SSS/SHS and higher. With the exception of some few cases those with sight related disabilities recorded the highest number of people in almost all educational levels except.. This trend applies even for both males and females. More females (51.4%) never attended school, as compared to males (35.6%).

**Table 6.3: Population 3 years and older by sex, disability type and level of education**

Sex/disability type	Population		Educational level attained

# **CHAPTER SEVEN**

## **AGRICULTURAL ACTIVITIES**

### **7.1 Introduction**

The district's economy is predominantly agrarian, largely due to the sector's contribution to Gross Domestic Product (GDP) of the district largely in terms of labour absorption and foreign exchange earnings. The objective of this chapter is to analyse the types of farming activities, crops and trees grown, livestock reared, and fish farming being practised in the Ahafo Ano North District.

### **7.2 Households in Agriculture**

Agricultural households are said to be those households where at least one member is engaged in at least one agricultural activity or another. Agriculture alone employs more than 60 percent of the labour force in Ghana and this pattern is also observed in the Ahafo Ano North District hence the need to analyse the households in agriculture.

Table 7.1 shows that out of 20,994 households in the district, a substantial number (15,605) are said to be agricultural households with only 5,389 households being non-agricultural households. Thus 74.3 percent of households in district are engaged in one agricultural activity or another with 25.7 percent of households into other non-agricultural economic activities. Again, the table depicts that a sizeable number of rural households (84%) in the district are into agriculture as compared to what can be found in the urban areas of (40.9%). It must be noted that the reporting of this agricultural activities is not exclusive, hence multiple responses were accepted hence, percentage computations may not add up to hundred. In the rural areas a higher proportion, of the households are involved in agriculture simply due to the fact that agriculture is essentially a rural activity. Of the agricultural households in the district 98.3 percent are into crop farming, 0.3 percent are into tree planting, 28.6 percent are involved with livestock rearing and only 0.1 percent are into fish farming

Out of the number of the urban agricultural household 96.3 are involve in crop farming, 0.4 percent are into tree planting and 18.3 percent are into livestock rearing whilst only 0.1 percent are into fish farming. In the rural areas however, 98.6 percent of the agricultural households are into crop farming, 0.3 percent are into tree planting and livestock rearing is undertaken by 30.1 percent of the rural agricultural households with a very insignificant proportion (0.0004%) of households involved in fish farming.

**Table 7.1: Households by agricultural activities and locality**

Agriculture activities	Total		Urban		Rural	
	Number	Percent	Number	Percent	Number	Percent
Total Households	20,994	100.0	4,712	100.0	16,282	100.0
Households engages in Agriculture	15,605	74.3	1,929	40.9	13,676	84.0
Crop Farming	15,341	98.3	1,858	96.3	13,483	98.6

Fish Farming	8	0.1	2	0.1	6	0.0

Source: Ghana Statistical Service, 2010 Population and Housing Census

### 7.3 Types of Farming Activities

A total of 7,154 keepers are involved in rearing of livestock in the district with nearly half (3,040) of the keepers into chicken rearing followed by goat (1,737) and sheep (1,547) keepers in that order. Table 7.2 shows the distribution of livestock and keepers in the district. Fish farming is rarely practiced by households in the district as less than one percent of the households are engaged in it. The data indicates that nearly one third (28.6%) of the agricultural households can be said to be rearing livestock in the district.

As indicated in Table 7.2, the most predominant livestock reared in the district are chicken (65.3%), followed by sheep (12.6%) and goats (12.2%). Bee keeping and fish farming are least practiced in the district 0.1 percent and 0.2 percent respectively. Guinea fowls (2.4%), ducks (1.7%), cattle (1.2%) and pigs (1.5%) feature quite well in the district. It is interesting to note that some households are into snail and grass cutter rearing to supplement their income and to provide for their food needs.

**Table 7.2: Distribution of livestock, birds, others reared and keepers**

Type of livestock	Animals		Keepers		Average per keeper
	Number	Percent	Number	Percent

# CHAPTER EIGHT

## HOUSING CONDITIONS

### 8.1 Introduction

The provision of periodic information on housing and housing conditions is important both to assess what has been achieved and to plan ahead. The 2010 Census provides an official count of all structures (permanent and temporary) within the district. Among the topics covered were the number of occupied and unoccupied dwelling units, the type of dwelling and the main materials used in house construction, occupancy status, method of waste disposal, utilities and household facilities.

Information obtained from the census indicates that housing quality, access to potable water as well as sanitation, serve as important indicators of the quality of life of the occupants'. Such information can aid the government in designing housing improvement programmes.

It also helps to determine the adequacy of housing stock and assessment of the need for additional housing. It may also provide information on living conditions of those residing in temporary or substandard housing in the district.

Secure tenure is the ability to live in a place without fear of eviction. This secure tenure provides basic physical, economic and physiological security.

The type of materials used for construction of dwelling units to a large extent determines the conditions of the houses as well as the occupants' socio- economic status in the district

### 8.2 Housing Stock

Table 8.1 puts the total housing stock in the district at 14,819. The proportion of houses in rural areas 86.4 percent (12,807) is higher than that in the urban areas 13.6 percent(2012). The population per house is 6.3 for the district with are average household size of 4.4 which is the same as the national average but higher than the regional average. There seem to be more people in the urban houses (8.6) than can be found in the rural houses (5.9) in the district. The average household size in the rural areas (4.6) is slightly higher than that of urban areas (3.7).

**Table 8.1: Stock of houses and households by type of locality**

Categories	Total				
	country	Region	District	Urban	Rural
Total population	24,658,823	4,780,380	94,285	17,758	76,527
Total household population	24,076,327	4,671,982	92,924	17,381	75,543
Number of houses	3,392,745	574,066	14,819	2,012	12,807
Number of households	5,467,054	1,126,205	20,994	4,712	16,282
Average households per house	1.6	2.0	1.4	2.3	1.3
Population per house*	7.1	8.1	6.3	8.6	5.9
Average household size	4.4	4.1	4.4	3.7	4.6

### 8.3 Type of dwelling Unit

Table 8.2 shows the types of occupied dwelling unit by sex of household head and type of locality in the district. It indicates that among the dwelling units in the district, separate houses constitutes 32 percent, and compound houses are the leading type of dwelling unit in the district, and constitutes 49.2 percent, with semi-detached houses forming 7.4 percent. The least common type of dwelling unit in the district is the tent.

In terms of the sex of the head of the household, among the male headed households 45.5 percent are occupying compound houses rooms and 34.2 percent are occupying separate houses, while 7.5 percent occupy semi-detached houses. Similarly among the female headed households the data indicates that 58.8 percent of female headed households are occupying compound houses rooms and 26.3 percent are in separate houses whilst 7.2 percent are in semi-detached houses. The least occupied type of dwelling unit occupied by the two is tent.

For out of every three dwelling units in the urban communities in the district two are compound houses i.e. 66.6 percent and 17.4 percent are separate houses while 9.3 percent are semi-detached houses. In the rural areas in the district 44.1 percent of the dwelling units are compound houses and 36.2 percent are separate houses whilst 6.9 percent are semi-detached houses.

It is evident that the three types of dwelling units namely compound houses, separate houses and semidetached houses constitutes the most common type of dwelling units in the district. The three together form 88.6 percent of the dwelling units in the district, they constitutes 90.9 percent of dwelling units occupied by male headed households and 92.3 percent of dwelling unit type occupied by female headed households. In the urban areas they constitute 93.3 percent of dwelling units and 87 Percent in the rural areas.

**Table 8.2: Type of occupied dwelling unit by sex of household head and type of locality**

Type of dwelling	Total country	Region	District					
			Total		Male headed	Female headed	Urban	Rural
			Number	Percent				
Total	5,467,054	1,126,205	20,994	100.0	100.0	100.0	100.0	100.0
Separate house	1,471,391	266,516	6,722	32.0	34.2	26.3	17.4	36.2

## 8.4 Type of Dwelling Holding and Tenancy Arrangements

As presented in Table 8.3 more than half (55.1%) of the households in the district live in houses owned by a household member. About one out of five households (21.8%) live in dwelling units owned by other private individual with 13.2 percent of the households dwelling in houses put up by relatives who are not household's members. Only two percent of the households live in public/government houses. This ownership status pattern in the district bears semblance of both regional and national dwelling unit ownership status.

The data again indicates that both male and female headed households who live in their own dwelling units (i.e. owned by household member and relative not a household member) are more than half in the district. Nearly 60 percent of the rural households live in their own houses compared to 42.4 percent of the urban households. Almost one third of households in the urban areas live in rented houses whereas a little over 18 percent of the rural households rent houses in the district.

There are higher proportions of households in the urban areas (3.%) who dwell in public/government houses than can be found in the rural areas within the district (1.5%).

**Table 8.3: Ownership status of dwelling by sex of household head and type of locality**

Ownership status	District							
	Total country	Region	Total		Male headed	Female headed	Urban	Rural
			Number	Percent				
Total	5,467,054	1,126,205	20,994	100.0	100.0	100.0	100.0	100.0
Owned by household member	2,883,236	471,623	11,578	55.1	55.3	54.8	42.4	58.8
Being purchased (e.g. mortgage)	45,630	13,648	182	0.9	0.9	0.9	1.7	0.6
Relative not a household member	851,630	218,145	2,781	13.2	11.5	17.9	15.6	12.6

## 8.5 Construction Materials

Table 8.4 indicates that a significant percentage of houses (62.9%) in the district used mud bricks/earth as their main construction materials for outer walls followed by cement blocks (30.9%). This pattern sharply deviates from both the regional and the national patterns where cement blocks/concrete are the dominant construction materials for their outer walls followed by mud bricks/earth. The high proportion of mud bricks/earth houses in the district may be due to the cost of the cement.

The data indicates that in the rural areas mud bricks/earth houses alone account for 75.7 percent compared to 17.2 percent of cement blocks/concrete houses. This is however different in urban areas where a sizable number of houses (80.1%) have cement blocks/concrete as their construction materials of their outer walls. Stone, burnt bricks, palm leaf/thatch form an insignificant percentage of houses in the district. Landcrete is commonly used in the rural areas (3.4%) than can be found in urban areas (0.8%) in the district.

**Table 8.4: Main construction material for outer wall of dwelling unit by type of locality**

Material for Outer wall	Total country	Region	District			
			Total		Urban	Rural
			Number	Percent		
Total	5,817,607	1,169,030	22,425	100.0	100.0	100.0

### 8.5.1 Main construction materials for the floor

Table 8.5 indicates that cement/concrete (68.6%) is the main construction material used for the floor of houses followed by earth/mud (29.3%). Ceramic/porcelain/granite/marble tiles are not popular in the rural areas as insignificant percent are (0.8%) of houses have their floors made of ceramic/porcelain/granite/marble tiles compared to 1.7 percent in the urban areas.

**Table 8.5: Main construction materials for the floor of dwelling unit by type of locality**

Materials for the floor	Total country	Region	District			
			Total		Urban	Rural
			Number	Percent		
Total	5,467,054	1,126,205	20,994	100	100	100
Earth/Mud	872,161	164,333	6,143	29.3	11.4	34.4
Cement/Concrete	4,255,611	875,714	14,412	68.6	85.5	63.8
Stone	32,817	8,731	100	0.5	0.4	0.5

## 8.5.2 Main construction material for roofing

Table 8.6 provides information on type of materials used in roofing houses in the district. According to the data, as high as 92.8 percent of households in the district live in structures whose roofing materials are metal sheets. Thatch/palm leaf or raffia which is the next material used by households in the district as roofing material and it is comparatively used more among rural households (4%) than among urban households (0.5%).

Similarly, the use of bamboo as roofing material in the district is prevalent in rural dwelling units (1.2%) and 0.2 percent among urban as shown in Table 8.5.

The data further shows that mud/mud bricks/earth, wood, slate/asbestos, cement/concrete and roofing tiles are rarely used as roofing material by households in the district as the use of each is below 1.0 percent.

**Table 8.6: Main construction material for roofing of dwelling unit by type of locality**

Main Roofing material	Total country	Region	District			
			Total		Urban	Rural
			Number	Percent		
Total	5,817,607	1,169,030	22,425	100	100	100
Mud/Mud bricks/Earth	80,644	4,885	212	0.9	0.6	1.0
Wood	45,547	10,933	166	0.7	0.6	0.8

## 8.6 Room Occupancy

The number of persons sleeping in a room is very critical as it has health implications in terms of spreading communicable diseases. Communicable diseases tend to spread fast in rooms where there are many occupants than where few persons sleep together. Table 8.7 shows that more than half (56.2%) of the households in the district use one room for sleeping followed by two rooms (25.2%). The data also indicate that among single member households 90.7 percent use one room for sleeping.

**Table 8.7: Household size and number of sleeping rooms occupied in dwelling unit**

Household size	Total		Number of sleeping rooms								
	Number	Percent	One room	Two rooms	Three rooms	Four rooms	Five rooms	Six rooms	Seven rooms	Eight rooms	Nine rooms or more
Total	20,994	100.0	56.2	25.2	10.4	4.6	1.8	0.9	0.4	0.2	0.2

## 8.7 Access to Utilities and Household facilities

### 8.7.1 Main source of lighting of dwelling unit

From Table 8.8, almost half (49.0%) of the households in the district make use of flashlight/torch as their main source of lighting. A substantial proportion of households (59.2%) in the rural areas and 13.8 percent of the households in urban areas depend on this source for lighting. Kerosene lamp (13.1%) is the next highest source of light for households in the district. About 15.5 percent of rural households and 4.7 percent of urban households make use of this source for lighting.

The data again show that households with access to the national electricity grid in the district account for 36.2 percent. There is great disparity with regard to households with access to electricity between the rural areas and the urban areas as a higher proportion of urban households (79.9%) use electricity as their main source of light compared to 23.6 percent of rural households.

Less than one percent of all households in the district depend on generators and gas lamps as their source of light. Other sources such as solar energy and firewood are rarely used in the district and utilized only among rural households.

**Table 8.8: Main source of lighting of dwelling unit by type of locality**

Main source of light	Total country	Region	District			
			Total		Urban	Rural
			Number	Percent

### 8.7.2 Main source of fuel for cooking

The over dependence on firewood and charcoal is not only detrimental to the environment but also the health of household members.

Table 8.9 shows that 71.4 percent of the households in the district use wood as their main source of fuel, 16.2 percent use charcoal and 5.8 percent use gas. However, the use of wood is predominant among rural households (84.8%) compared to 25 percent of urban households. Charcoal constitutes the predominant source of fuel for cooking for urban households as 49.1 percent of urban households use charcoal for cooking. Other sources of fuel for cooking such as electricity, kerosene and crop residue are rarely used in the district. This situation is similar in the region and in the country as a whole

### 8.7.3 Cooking space used by household

Almost half (47.8%) of the households in the district either use a separate room/kitchen exclusive or shared as their space for cooking as shown in Table 8.9. It is seen that 28.5 percent of the households in the district use their veranda or open space in the compound as cooking space. These two spaces for cooking are common among urban households as a little more than half (50.9%) of the households make use of these two spaces compared to 22 percent of rural households.

Apart from the 6.2 percent of households in the district which have no space for cooking, a slightly higher proportion of 14.5 percent make use of structures with roof but no walls as their cooking space, whereas 2.4 percent make use of enclosure without roof as cooking space with 0.4 percent making use of their bedroom hall/living room as cooking space. On the other hand, the use of separate room for exclusive or shared and the use of veranda and open space in compound is prevalent both in the district and in the region.

**Table 8.9: Main source of cooking fuel, and cooking space used by households**

## 8.8 Main Source of Water for drinking and for Domestic Use

Table 8.10 indicates that 43.2 percent of households use borehole/pump/tube well as their main source of drinking water followed by pipe borne water (33.6%), however 17.7 percent of the households get their source of water from rivers/streams.

In the rural areas 22.6 percent of the households get their water supply from river/stream compared to a lower proportion for the urban areas (1.0%). There is however a noticeable disparity between rural and urban dwellers who use bore holes. Whereas in the rural areas more than half (51.0%) of the households in the district rely on this source, a little over one third (37.2%) of the households rely on this source in the urban areas.

As shown in Table 8.10, in the urban areas 85.9 percent of the households depend on pipe borne water irrespective of the facility location and for their domestic uses with only 11.3 percent of households relying on this same source. In the same vein only 17.2 percent of the rural households are served with pipe borne water in the district.

It can be noted from Table 8.10 that more than 20 percent of rural households depend on streams and rivers as against 2 percent for urban households for both drinking and other domestic uses.

**Table 8.10: Main source of water for dwelling unit for drinking and other domestic purposes**

Source: Ghana Statistical Service, 2010 Population and Housing Census

It can be seen that only few households (0.1%) use bottled and sachet water as their main source of drinking water in the district. Rivers and streams constitute a significant source of water for rural households (22.6%) compared to urban households (1%).

## 8.9 Bathing and Toilet Facilities

The data show that 36 percent of the households share separate bathroom in the same house this is followed by (25.5%) households who have their own bathroom for exclusive use. One out of every 10 (10.5%) households in the rural areas use private open cubicle as their bathing facility compared to urban areas (5.3%).

Table 8.11 indicates that almost half (49.4%) of households use public toilet followed by (35.7%) pit latrine. More households in urban areas (20.4%) use KVIP compared to those in rural areas (4.3%). In the district 4 percent of the households use bush as their toilet facility which is lower compared to the regional figure of 6.3 percent and 19.3 percent for the national. This is more prominent in the rural areas where 4.2 percent of the households practice open defecation compared to 3.2 percent for urban areas.

Pit latrine is very prevalent in the rural areas whereas KVIP toilets are more prominence in the urban areas than in rural areas. It is also clear that there is a remarkable difference between urban (7.5%) and rural (0.9%) households who make use of water closet which may be attributed to availability of pipe borne water in some houses in urban areas for flushing of the facility.

**Table 8.11: Type of toilet facility and bathing facility used by household by type of locality**

## **8.10 Methods of Waste Disposal**

Waste disposal practices continue to be a rising challenge as population grows along with the industrial development of countries with increase urbanization. Some years ago, people would have the rubbish from their homes collected and transported and dumped in the places far away from the city or village. Today, instead of open dumping, usually the rubbish is collected and transported to landfills and then buried. Waste disposal methods vary widely between areas for many reasons including type of waste material, nearby land availability and use. Just as the practice differs between developed and developing nations it also varies from urban to rural areas, and for residential to industrial producers as well as between different households.

### **8.10.1 Solid waste disposal**

As indicated, Table 8.12 shows method of solid and liquid waste disposal by households and type of locality, two-thirds of the households dispose of their solid waste through public dump (open space) while 6.9 percent used containers placed at public dumps. However, a 7.6 percent of urban households and 13.7 percent of rural households constituting 12.3 percent of total households in the district dump their solid waste indiscriminately, 5.1 percent of the households and 4.1 percent of the households in the district also dispose their solid waste by burning and burying respectively.

There is the need to reduce burning and dumping of refuse indiscriminately which have serious health implications on the households. Public dumps (open space) must be well managed to avoid air pollution and littering of polythene bags especially in the urban centres.

### **8.10.2 Liquid waste disposal**

Data on methods of liquid waste disposal are presented in Table 8.12. The methods of liquid waste disposal for households are throwing onto street/outside method (33.5%), throwing onto compound (49.2%) and soak away (11.1%). The proper method of liquid waste disposal which is through the sewerage system and through a drainage system into gutter altogether constitutes just 6.2 percent.

Throwing liquid waste into gutter method on the other hand accounts for 9.3 percent and it is predominant among the urban households. Throwing liquid waste onto street/outside method, throwing onto compound method and soak away method contribute to the poor health conditions in the district as these methods lead to stagnation of water with its attendant outbreak of malaria and other related water borne diseases.

**Table 8.12: Method of solid and liquid waste disposal by type of locality**

# **CHAPTER NINE**

## **SUMMARY OF FINDINGS, CONCLUSIONS AND POLICY IMPLICATIONS**

### **9.0 Introduction**

The demographic, social and economic characteristics as well as information communication technology, disability, agricultural activities and housing conditions in the Ahafo Ano North District has been analysed in the previous Chapters. This chapter provides summary of findings, conclusion and attempt to suggest some recommendations.

### **9.1 Summary of Findings**

#### **Demographic Characteristics**

The Ahafo Ano District is located between latitude 6° 47'N and 7° 02'N and longitude 2° 26'W and 2° 04'W with a total area of 593.7km<sup>2</sup> and a Population density of 158.

The population of Ahafo Ano North District according to 2010 Population and Housing Census is 94,285 comprising 47,956 males (50.9%) and 46, 329 females (49.1%) giving sex ratio of 103.5 males to 100 females. The proportion of the male population is higher than that of females and it is higher in the rural areas than the urban. Children under 15 years constitute 41.1 percent while persons aged 65 years and older accounts for 4.6 percent of the district population according to the 2010 PHC results. Ahafo Ano North district is said to be predominantly rural as over 80 percent of the population live in rural areas as against about 20 percent of the population in urban areas. Nearly half of the population of the district (40,663) is reported as migrants with almost 29 percent of the migrant population originating from the three northern regions of Ghana.

#### **Education and Literacy**

Education is said to be the key factor in sustainable development in any country. It was found out that nearly 30 percent of the population 12 years and older had no education while a substantial proportion of 57.2 percent had attained basic education. With regard to those who had never been to school the percentage of females (35.2%) is slightly higher than that of the males (23.9%).

There is a huge gap between males and females with regards to literacy. Literacy among males is higher (76.9%) than that of females (65.8%). The proportion of the population 11 years and older who are literate in only a Ghanaian language is generally low 14.3 percent. There is a growing phenomenon where younger persons and children are increasingly becoming literate in English only. It can be observed that the proportion of the population aged between 11 years and 24 years who are literate in English language alone 64.1 percent is slightly higher than the proportion of the same age group who are literates in a Ghanaian language only 47.8 percent. This may be attributed to the fact that an increasing number of highly educated couples use English as the only medium of communication with their children at home.

## **Economic Activities**

Agriculture- related work and private informal sector were the leading employers of the labour force. The public sector is not a major employer of the labour force employing only 18.2 percent of the population 15 years and older. This is perhaps due to the relatively low skills and experience many of the citizens may possess. A higher proportion of females (6.0%) than males (3.6%) working in the manufacturing sector in the district. It was also observed that females (2.4%) dominate as apprentices compared to their males (1.1%) counterparts. This may mean that females prefer to learn trade than to continue to further education after basic education.

## **Information Communication Technology**

In the district, 33.1 percent of persons 12 years and older own mobile phone.

The share of internet users is considerably low as only 1.4 percent of persons 12 years and older use internet from any location in the district which is far lower than the national percentage of 7.8 percent. It is hoped that with the advent of portable modems coupled with government policy of “One laptop per child” the proportion of the population with access to internet facilities is likely to increase at a fast rate especially so with the rural areas to bridge the digital divide between the urban and the rural folks. The delivering of free laptops by the government to some tertiary students need to be looked at in order to ensure that all the deserving students and pupils have access to computers in the district. The Government of Ghana through the Ghana Investment Fund for Electronic Communication (GIFEC) is putting up community information centres in a number of communities in the country. These centres come with internet facilities and need to be continued and sustained in order to reach out to as many people as possible especially in the rural areas.

The Government’s Self Help Electrification Programme (SHEP) for provision of electricity to the rural areas needs to be continued and expanded at a very fast rate to enable the rural people have access to electricity since it is a prerequisite for internet and mobile phone use. This would enable the citizens to charge not only their mobile phones’ batteries but also charge their computers’ batteries as well as to have access to the internet facilities at the community information centres.

In the district only 2.6 % of households own laptop/desktop computer compared to 7.9% at the national level. The proportion of households with access to desktop and laptop computers is likely to increase in the future due to the government policy of “One child per computer policy” mentioned earlier in this section and the free supply of laptops to tertiary students.

## **Disability**

According to the 2010 PHC, 2,224 persons (2.4%) in the district suffering from various forms of disabilities of with approximately 73.7 percent live in rural areas of the district. Thus majority of the people with disability are in the rural areas.

## **Agricultural Households**

It is not surprising to note that 74.3 percent of the households engage in one form of agricultural activity or the other. Pragmatic programmes need to be put in place to support the farmers to produce enough food, livestock and cash crops as the sector alone absorb more than 70 percent of the working population.

## **Housing Conditions**

In Ahafo Ano North District nearly 63 percent of the houses are built of mud/bricks with more than 30 percent of the houses made of cement and concrete. It was observed from the 2010 Census data that nearly 60 percent of the rural households live in their own houses compared to 42.4 percent of the urban households. This may mean that teachers and government workers who are posted to the rural areas find it a bit difficult to get decent residential accommodation since most of the mud/earth houses are not in good conditions. Moreover, in the rural areas the rooms are normally shared among family members thereby making it difficult to rent out some of the rooms to prospective tenants.

The proportion of households that use safe cooking fuel in the district is less than 6 percent. There is not much disparity between the rural and urban households in the use of improved cooking fuel. The over dependence on firewood and charcoal is not only detrimental to the environment but also the health of household members.

Accessibility to safe drinking water is higher for urban households (97.1%) in the district than rural households (70.9%). In the district nearly one fifth (24.9%) of the rural households depend on streams and rivers as their main source of drinking water. This not only poses a lot of health risks but time washing as children and women need to spend a lot of time in search of water at the expense of their studies and work respectively.

The bush continue to be use as a toilet facility for 4 percent for of the households in the district while 12.3 percent of households dump their waste indiscriminately anywhere they find space. The data show that households with access to the national electricity grid in the district account for 36.2 percent.

## **9.2 Conclusions and Policy Implications**

### **Sex Ratio**

The sex ratio for the district (103.5) deviates from the national (95.2) and regional (95.0) sex ratios in which females rather dominate. This trend could be attributed to the significant presence of migrants especially from the three northern regions, who usually prefer to migrate alone leaving their wives at home till they are well established before they bring their wives to join them. In the same vein the population of the district is predominantly rural which again does not bear similar pattern of the national and regional.

### **Migration**

The percentage of the population (80.1%) living in rural areas in the district is relatively higher than can be found in urban areas (19.9%). This pattern does not bear semblance of both the national and the regional pattern.

## **Literacy**

For educational attainment the proportion of the population 3 years and older that have ever attended school is lower than the regional percentage. The 2010 census data show that among the population 12 years and older 70.6 percent had ever attended school or were in school. Females (64.8%) were less likely to have attended school than males (76.1%). The proportion of population 11 years and older who are literates in the district is 71.4% which falls below the regional figure (82.6%).

It has been consistently argued that for the crucial change in behavioural attitudes to occur especially in the family size, family planning and rejection of outmoded traditional practices, education of females to at least the secondary school level is imperative. Expanding educational opportunities for women is widely recognised as the key to the improvement of women and the elimination of the inequalities inflicted on them by society. The District Assembly and the District Education Directorate need to ensure that the gap between males and females in education be bridged through increased sponsorship package especially for females and community sensitisation drive.

The practice of being literate in only a foreign language should be discouraged by making it compulsory for every child to learn one Ghanaian language in both private and public schools. This is to facilitate the instilling of a sense of national identity. The learning of French should be encouraged as Ghana is surrounded by French speaking countries at all the borders except the south.

In this regard supporting the apprenticeship training could go a long way to address the employment needs of the youth in the district. The need to encourage pupils especially the girl-child to continue to the next level of education rather than learning trade should be vigorously pursued. Since the public sector is limited in creating job opportunities the public institutions should partner the private sector to do so by formulating pragmatic policies and framework for the private sector to thrive in.

The Government Scholarship for cocoa farmers' wards should to be reviewed in order to reach the actual wards of the farmers. In the current situation most of the beneficiaries are not the wards of the farmers. In most cases the children of the staff of Cocoa Board benefit from such scholarship to the detriment of the farmers.

It is therefore recommended that the District Assembly should provide staff accommodation for teachers and nurses especially in the rural areas to attract and retain qualified staff in the district.

## **Economic Activity Status**

Females form a significant proportion (30.2%) of economically not active population compared to the males (25.6%). This may be due to the fact women are regarded as homemakers in the society. There is also a higher percentage of females (18.4%) contributing to family work than males (7.6%). It was reported that female managers constitute 1.1 percent as against male managers of 0.7 percent.

Females form a substantial proportion (20.5%) of the population who are engaged as service and sales workers compared to 3.6 percent for males. The District Assembly needs not only to

collaborate with the telecommunication service providers to improve their services but also to cover greater parts of the district since most people have come to depend on mobile phones to transact their businesses. This can be done through tax rebate and tax holidays to attract these service providers to the deprived communities in the district.

### **Fertility**

The average number children ever born to women aged between 15 years and 49 years decreases with age of women. The proportion of deaths which occurred 12 months preceding the census indicates that under- five deaths alone accounted for nearly one third. The large size of the population of children puts a burden on the state regarding their education and health. At the same time the state would have to consider its' economic wellbeing through the expansion of job opportunities and to create the enabling environment for the private sector to expand to absorb the increasing population that enters the labour force every year. The government should continue to expand educational infrastructure at all levels to ensure that children of school going age have access to primary school education. The health sector needs to reposition its family planning programme in order to reduce the high fertility rate.

### **Housing Conditions**

The percentage of houses in the district (68.9%) whose outer walls are made of mud and earth far exceeds the proportion recorded in the region.

Electricity is only available to 36.2 percent of the households within the district compared to 86 percent of the regional coverage. There is great discrepancy in the provision of toilet facilities in the district. Nearly 4.2 percent of the households were reported to be using the bush as their place of convenience. More than half of the households are said to be relying on public toilets as they do not have their own toilet facilities. Whereas households in the district have access to potable water the percentage is far below the regional percentage.

The District Assembly needs to provide social amenities such as health, educational and water facilities in the rural areas in order to make life more meaningful for them to continue to produce the necessary food and raw materials to feed the industries. The road networks in the district need to be motorable all year round to enable the agricultural produce reach the marketing centres on time and in good conditions to minimise the rate of post- harvest losses.

The Government needs to reconsider the withdrawal of subsidy on liquefied petroleum gas to enable more people use the product. The District Assembly needs to encourage the private sector to set up more stations in the district by creating enabling environment including tax rebate for prospective business owners who wants to establish such ventures.

### **Disability**

With more than 2 percent of the population having some forms of disability in the district, their needs need to be catered for in planning and implementation of projects and programmes. All public buildings such as schools, health centres and public place of convenience in the district should cater for needs of PWDs to enable them have access to these facilities.
