### Overview

---

**ABSTRACT**

The principal objective of the 2003 Ghana Demographic and Health Survey (GDHS) is to provide data to monitor the population and health situation in the country. This is the fourth round in a series of national-level population and health surveys conducted in Ghana under the worldwide Demographic and Health Surveys Program.

The primary objective is to provide current and reliable data on fertility and family planning behaviour, infant and child mortality, breastfeeding, antenatal care, children's immunisations and childhood diseases, nutritional status of mothers and children, use of maternal and child health services, and awareness and behaviour regarding AIDS and other STIs. New features of the 2003 GDHS include the collection of information on female and male circumcision, information on malaria and ownership and use of insecticide-treated bed nets, and haemoglobin and HIV testing.

The long-term objective of the survey includes strengthening the technical capacity of major government institutions, including the Ghana Statistical Service (GSS). The 2003 GDHS also provides comparable data for long-term trend analyses in Ghana, since the surveys were implemented by the same organisation, using similar data collection procedures. It also contributes to the ever-growing international database on demographic and health-related information.

**KIND OF DATA**

Sample survey data [ssd]

**UNITS OF ANALYSIS**

Individuals

### Scope

---

**NOTES**

The scope of the 2003 Demographic and Health Survey includes:

- HOUSEHOLD: Household schedule, household characteristics, education, water and sanitation, salt iodization, housing characteristics, security of tenure and durability of housing.

- WOMEN(15-49): Respondent background, literacy, reproduction and birth history, pregnancy and breastfeeding, antenatal and post natal care, contraception, immunization and health, marriage, fertility preferences, women's work, husband's/partner's background, HIV/AIDS and anthropometrical measurement.

- MEN (15-59): Respondent's background, literacy, employment, reproduction, contraception, marriage, fertility preference and HIV/AIDS.

**TOPICS**

| Topic                       | Vocabulary | URI |
|-----------------------------|------------|-----|
| Social Development          | World Bank |     |
| Children & Youth            | World Bank |     |
| Gender                      | World Bank |     |
| Participation / Empowerment | World Bank |     |

## Coverage

---

**GEOGRAPHIC COVERAGE (1)**

National level

**GEOGRAPHIC COVERAGE (2)**

Regional level

**GEOGRAPHIC UNIT**

Regional I

**UNIVERSE**

All household members, all women 15-49 years, all men 15-59 years and children under 5 years living in Ghana except residence in Refugee camps.

# Sampling

## Sampling Procedure

---

The sample for the 2003 GDHS covered the population residing in private households in the country. A representative probability sample of about 6,600 households was selected nationwide. The list of enumeration areas (EAs) from the 2000 Ghana Population and Housing Census was used as a frame for the sample.

The frame was first stratified into the 10 administrative regions in the country, then into rural and urban EAs. The sample was selected in such a manner as to allow for separate estimates for key indicators for the country as a whole, for each of the 10 regions in Ghana, as well as for urban and rural areas separately.

The 2003 GDHS used a two-stage stratified sample design.

At the first stage of sampling, 412 sample points or EAs were selected, each with probability proportional to size, based on the number of households. A complete household listing exercise was carried out between May and June 2003 within all the selected EAs (clusters).

The second stage of selection involved systematic sampling of households from this list. The sample selected per EA varied by region depending on the population size. Fifteen households per EA were selected in all the regions except in Brong Ahafo, Upper East, and Upper West regions, where 20 households per EA were selected, and in the Northern region, where 16 households per EA were selected.

## Deviations from Sample Design

---

There was no deviation

## Response Rate

---

A total of 6,628 households were selected in the sample, of which 6,333 were occupied at the time of fieldwork. The difference between selected and occupied households is largely due to structures being vacant or destroyed. Successful interviews were conducted in 6,251 households, yielding a response rate of 99 percent.

In the households interviewed in the survey, a total of 5,949 eligible women age 15-49 were identified; interviews were completed with 5,691 of these women, yielding a response rate of 96 percent. In the same households, a total of 5,345 eligible men age 15-59 were identified and interviews were completed with 5,015 of these men, yielding a male response rate of 94 percent. The response rates are slightly lower for the urban than rural sample and among men than women. The principal reason for non-response among both eligible women and men was the failure to find individuals at home despite repeated visits to the household. The lower response rate for men reflects the more frequent and longer absences of men from the household, principally related to their employment and life style.

Response rates for the HIV testing component were lower than those for the interviews. In fact, the coverage rate for testing among women is consistent across all age groups (88 to 91 percent). Response rates are somewhat have more variations by age among men (77 to 83 percent).

## Weighting

---

The variable Sample weight was used to weight the data

# Questionnaires

## Overview

---

Three questionnaires were used for the 2003 GDHS: the Household Questionnaire, the Women's Questionnaire, and the Men's Questionnaire. The contents of these questionnaires were based on the model questionnaires developed by the MEASURE DHS+ programme and were designed to provide information needed by health and family planning programme managers and policymakers. The questionnaires were adapted to the Ghanaian situation and a number of questions pertaining to ongoing health, HIV, and family planning programmes were added. These questionnaires were translated from English into the five major languages (Akan, Nzema, Ewe, Ga, and Dagbani). The questionnaires are attached to the main report which is in the External Resources (Appendix E).

The Household Questionnaire was used to list all the usual members and visitors in the selected households. Information was collected on the characteristics of each person listed, including the age, sex, education, and relationship to the head of household. The main purpose of the Household Questionnaire was to identify eligible women and men for the individual interview. The Household Questionnaire collected information on characteristics of the household's dwelling unit, such as the source of drinking water, type of toilet facilities, flooring materials, ownership of various consumer goods, and ownership and use of mosquito nets. It was also used to record height and weight measurements of women 15-49 and children under the age of 5, and to record the respondents' consent to the haemoglobin and HIV testing.

The Women's Questionnaire was used to collect information from all women age 15-49. These women were asked questions on the following topics: respondent's background characteristics, such as education, residential history, media exposure, knowledge and use of family planning methods, fertility preferences, antenatal and delivery care, breastfeeding and infant and child feeding practices, vaccinations and childhood illnesses, childhood mortality, marriage and sexual activity, woman's work and husband's background characteristics, and awareness and behaviour regarding AIDS and other STIs.

The Men's Questionnaire was administered to all men age 15-59 in every household in the GDHS sample. The Men's Questionnaire collected much of the same information found in the Women's Questionnaire, but was shorter because it did not contain a reproductive history or questions on maternal and child health and nutrition.

**Note:**

The three questionnaires were merged together named GHS Questionnaires and attached to External Resources

## Data Collection

### Data Collection Dates

| Start   | End     | Cycle    |
|---------|---------|----------|
| 2003-07 | 2003-10 | 3 months |

### Time Periods

| Start | End | Cycle   |
|-------|-----|---------|
| 2003  |     | 5 years |

### Data Collection Mode

Face-to-face [f2f]

#### DATA COLLECTION NOTES

A pretest of the Household, Women's, and Men's questionnaires used in the GDHS was conducted in May 2003 in English and five major local languages. The pretest training was conducted by GSS staff for two weeks from 5-17 May 2003. In addition, nurses recruited from the Ghana Health Service were trained in testing for haemoglobin and collecting blood samples for HIV/AIDS. Five teams were formed to conduct the pretest. Each team consisted of a supervisor, four interviewers, and a nurse. Urban and rural areas were chosen for the pretest to get a better overall sense of the response level and acceptance of HIV/AIDS testing.

The lessons learned from the pretest were used to finalize the survey instruments and logistical arrangements.

#### Training and Fieldwork

A total of 102 interviewers, 23 nurses, and 12 data entry operators participated in the main survey training that took place from 6-27 July 2003. All participants were trained in interviewing techniques and the contents of the GDHS questionnaires. The training was conducted following the standard DHS training procedures, including class presentations, mock interviews, and tests using the Household, Women's, and Men's Questionnaires. All interviewers were trained in taking height and weight measurements. In addition to interviewer training, 23 persons (most of whom were nurses from the Ghana Health Service) were trained for a period of 10 days in anaemia testing, collection of blood samples for the HIV testing, and in informed consent procedures. An additional 20 interviewers were also trained in blood collecting techniques. In addition to in-class practice, the nurses were taken to the local health clinic to practice blood-collecting techniques on women, men, and children.

Interviewers and nurses were selected based on their in-class participation, performance in the field practices, fluency in the Ghanaian languages, and assessment tests. The most experienced trainees, those who took part in the pretest, and those who did extremely well, were selected to be supervisors and editors. Trainees selected as supervisors and field editors were given an additional two-days training on how to supervise fieldwork and edit questionnaires. In addition, there was one standby supervisor and nine interviewers ready for relief assignment whenever necessary. Ten regional statisticians acted as regional coordinators, and GSS staff coordinated and supervised fieldwork activities.

Fifteen teams were constituted for data collection. Each team was made up of a supervisor, an editor, a nurse, four interviewers, and a driver. Fieldwork lasted for three months from late July to late October.

ORC Macro provided technical assistance on all aspects of the survey; staff from ORC Macro participated in field supervision of interviews, height and weight measurements, and blood sample collection.

On average, 20 minutes was used to administer household questionnaire, about 50 minutes for women's questionnaire and about 30 minutes for men's questionnaire. Supervisors were provided with control forms to track the work done on the field. Members of the project implementing team also paid regular visits to the teams to ensure that they adhered to good data collection practices.

Women questionnaire collected information on the respondent's educational background, birth history, pregnancy and breastfeeding, marriage, use of contraception and knowledge about HIV/AIDS.

The men questionnaire also collected information on the respondent educational background, marriage, fertility, use of contraception and knowledge of HIV/AIDS.

### Data Collectors

| Name                      | Abbreviation | Affiliation         |
|---------------------------|--------------|---------------------|
| Ghana Statistical Service | GSS          | Government of Ghana |

### **SUPERVISION**

Fifteen teams were constituted for data collection. Each team was composed of a supervisor, an editor, four interviewer (two male & two females) a nurse and a driver. The supervisor was the team leader who had to oversee that team members follow and apply instructions. Interviewers had to edit their own work immediately after interview even before he/she leaves the household for onwards submission to the editor.

The editor then has to do thorough editing of the questionnaires before passing them on to the supervisor sample editing before questionnaires are sent to the project secretariat.

Ten Regional Statisticians, undertake regional monitoring exercise whereas zonal coordinators also embark on field monitoring to ensure data quality.

## Data Processing

### Data Editing

---

The 2003 GDHS data editing was implemented at three levels:

1. Field editing by interviewers, field editors and supervisors
2. Office editing
3. Data cleaning and imputation

### Other Processing

---

The processing of the GDHS results began shortly after the fieldwork commenced. Completed questionnaires were returned periodically from the field to the GSS headquarters in Accra, where they were entered and edited by data processing personnel who were specially trained for this task. Twelve data entry operators from GSS were trained for one week on data entry procedures using CPro. All data were entered twice (100 percent verification). In addition, tables were run periodically to monitor the quality of the data collected. The concurrent processing of the data was an advantage for data quality because field coordinators were able to advise teams of problems detected during the data entry. The data entry and editing phase of the survey was completed in mid-December 2003.

Blood samples were periodically collected in the field along with the completed questionnaires and transported to the GSS headquarters in Accra for logging in, after which they were taken to the Noguchi Memorial Institute for Medical Research (NMIMR) at Legon, for HIV testing.

A dried blood spot methodology to test for HIV using two Enzyme-Linked Immunosorbent Assay (ELISA) tests from different manufacturers that would also allow for sero-typing were setup to test blood samples for HIV.

All specimens were tested with a screening test, Vironostika HIV Uni-Form Plus O (ELISA I). All samples positive on the first screening test as well as 10 percent of the negatives were further tested in parallel with Wellcozyme HIV-1 Recombinant and Murex HIV-2 (ELISA II) for serotyping. Results for all the ELISAs were obtained by relating the absorbance value or optical density (OD) of a specimen to the OD of the serum controls.

According to the testing algorithm, samples positive on the first ELISA and positive on both the second ELISAs were regarded as positive for HIV-1 and HIV-2; samples positive on the first ELISA and positive on Wellcozyme HIV-1 Recombinant and negative on Murex HIV-2 were categorized as positive for HIV-1; similarly, samples that were positive on the first ELISA and negative on Wellcozyme HIV-1 Recombinant and positive on Murex HIV-2 were categorized as positive for HIV-2. Samples negative on the first ELISA and negative on ELISAs for serotyping were regarded as negative. Samples that had discordant results on ELISA I and ELISA II were tested again with ELISA I and ELISA II.

## Data Appraisal

### Estimates of Sampling Error

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the 2003 Ghana Demographic and Health Survey (GDHS) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically. Sampling errors, on the other hand, can be evaluated statistically.

The sample of respondents selected in the 2003 GDHS is only one of many samples that could have been selected from the same population, using the same design and expected size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability between all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design. If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the 2003 GDHS sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae.

The computer software used to calculate sampling errors for the 2003 GDHS is the ISSA Sampling Error Module. This module used the Taylor linearization method of variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as fertility and mortality rates. The Taylor linearization method treats any percentage or average as a ratio estimate,  $r = y/x$ , where  $y$  represents the total sample value for variable  $y$ , and  $x$  represents the total number of cases in the group or subgroup under consideration. The variance of  $r$  is computed using the formula given below, with the standard error being the square root of the variance.

## Other forms of Data Appraisal

Series of data quality checks were done to ensure that the data met required standards

### HAEMOGLOBIN AND HIV TESTING

In all households selected for the 2003 GDHS, women age 15-49 and children under age 5 were tested for anaemia. In addition, all eligible women and men were tested for HIV. Anaemia and HIV testing were only carried out if consent was provided by the respondents and in the case of a minor, by the parent or guardian. The protocol for haemoglobin and HIV testing was approved by the Ghana Health Service Ethical Review Committee in Accra and the ORC Macro Institutional Review Board in Calverton, Maryland, USA.

Haemoglobin testing is the primary method of anaemia diagnosis. In the GDHS, testing was done using the HemoCue system. A consent statement was read to the eligible woman and to the parent or responsible adult for young children and women age 15-17. This statement explained the purpose of the test, informed prospective subjects tested and/or their caretakers that the results would be made available as soon as the test was completed, and also requested permission for the test to be carried out, as well as the consent to report their names to health personnel in the local health facility if their haemoglobin level was low (severe).

Before the blood was taken, the finger was wiped with an alcohol prep swab and allowed to air-dry. Then the palm side of the end of a finger (in case of adults and children six months of age and older) was punctured with a sterile, non-reusable, self-retractable lancet and a drop of blood collected on a HemoCue microcuvette and placed in a HemoCue photometer, which displays the result. For children under six months of age (or for children under one year of age who were particularly undernourished and bony) a heel puncture was made to draw a drop of blood. The results were recorded in the Household Questionnaire, as well as on a brochure, which was given to each woman, parent, or responsible adult, that explained what the results meant. For each person whose haemoglobin level was low (severe), and who agreed to have the condition reported, a referral card was given to the respondent to be taken to a health facility.

### HIV/AIDS Testing

All eligible women and men who were interviewed were asked to voluntarily provide a few drops of blood for HIV testing. The protocol for the blood specimen collection and analysis was based on the anonymous linked protocol developed for DHS. The protocol allows for the merging of the HIV results to the socio-demographic data collected in the individual questionnaires, provided that information that could potentially identify an individual is destroyed before the linking takes place. This required that identification codes be deleted from the data file and that the back page of the Household Questionnaires that contain the bar code labels and names of respondents be destroyed prior to merging the HIV results with the individual data file.

If, after explaining the procedure, the confidentiality of the data, and the fact that the test results would not be made available to the subject, a respondent consented to the HIV testing, a dried blood spot (DBS) specimen was obtained from a finger prick. Each respondent who consented to being tested for HIV was given an information brochure on AIDS, a list of fixed sites providing voluntary counseling and testing (VCT) services throughout the country, and a voucher to access free VCT services at any of these sites for the respondent and/or the partner.

## File Description

# Variable List

## HOUSEHOLD DATA

|              |  |
|--------------|--|
| Content      | The file contains data relating to the household of the survey (Sex, Age and Educational attainment of Household members, relationship to Head of household, Marital Status, Parent survival status, source of drinking water, access to household durable goods, type of salt used for cooking and housing characteristics). It also contains the weighted coefficient. |
| Cases        | 6251   |
| Variable(s)  | 207  |
| Structure    | Type: relational<br>Keys: hhid(Case Identification), hv001(Cluster number), hv002(Household number)  |
| Version      | Version 1.0 was the uploaded version without external resources. Version 1.1 (September 2014 ) External resources attached and the literal questions provided with some editing done to other categories.  |
| Producer     | Ghana Statistical Service (GSS)  |
| Missing Data | All missing values have been identified and coded according to the following rules: -a coded value composed of 9s such that the entire length of the field is filled. For example a code of '999' would be used for a missing field of three characters. -not applicable or skipped variables are left blank.  |

## PERSON

|              |   |
|--------------|---|
| Content      | The eligible persons interviewed from the selected household consisted of women aged 15-49, men aged 15-59 and children under 5 years. The Women's Questionnaire was used to collect information from all eligible women. The information covered the following topics: respondent's background characteristics, such as education, residential history, media exposure, knowledge and use of family planning methods, fertility preferences, antenatal and delivery care, breastfeeding and infant and child feeding practices, vaccinations and childhood illnesses, childhood mortality, marriage and sexual activity, woman's work and husband's background characteristics, and awareness and behaviour regarding AIDS and other STIs. The Men's Questionnaire was administered to all men age 15-59 in every household in the GDHS sample. The Men's Questionnaire collected much of the same information found in the Women's Questionnaire, but was shorter because it did not contain a reproductive history or questions on maternal and child health and nutrition. The weights attached to the dataset is obtained by dividing the sample weight variable hv005 by one million (i.e. wt = hv005/1000000). |
| Cases        | 26601   |
| Variable(s)  | 136   |
| Structure    | Type: relational<br>Keys: hv001(Cluster number), hv002(Household number), hvidx(Line number)  |
| Version      | Version 1.0 was the uploaded version without external resources. Version 1.1 (September 2014 ) External resources attached and the literal questions provided with some editing done to other categories.   |
| Producer     | Ghana Statistical Service (GSS)   |
| Missing Data | All missing values have been identified and coded according to the following rules: -a coded value composed of 9s such that the entire length of the field is filled. For example a code of '999' would be used for a missing field of three characters. -not applicable or skipped variables are left blank.   |
